Intro to Visualizations

Daniel Anderson

Week 2, Class 1

Agenda

- Quick note on projects and `here::here()`

Discuss different visualizations

- Visualizing distributions
  - histograms
  - density plots
  - Empirical cumulative density plots
  - QQ plots
- Visualizing amounts
  - bar plots
  - dot plots
  - heatmaps

Learning Objectives

- Understand various ways the same underlying data can be displayed
- Think through pros/cons of each
- Understand the basic structure of the code to produce the various plots

What type of data do you have?

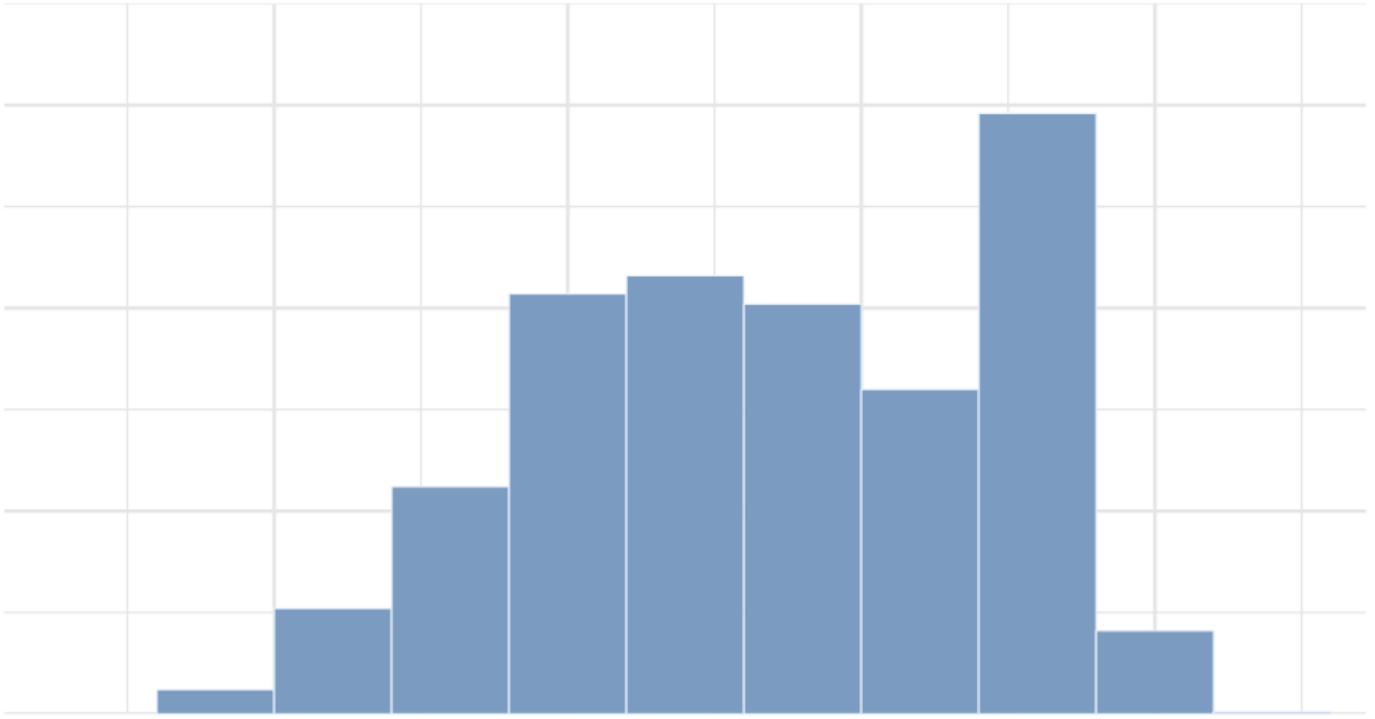
We'll focus primarily on standard continuous/categorical data

What is your purpose?

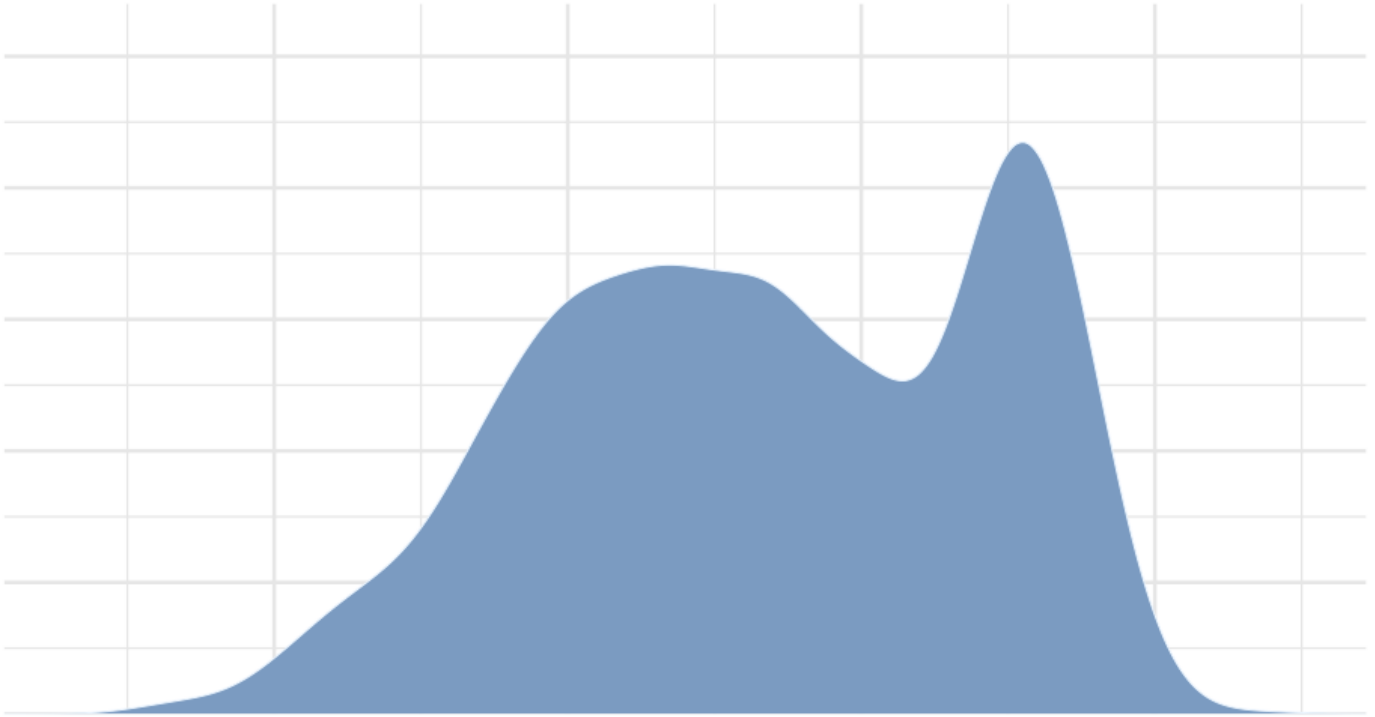
Exploratory? Communication?

One continuous variable

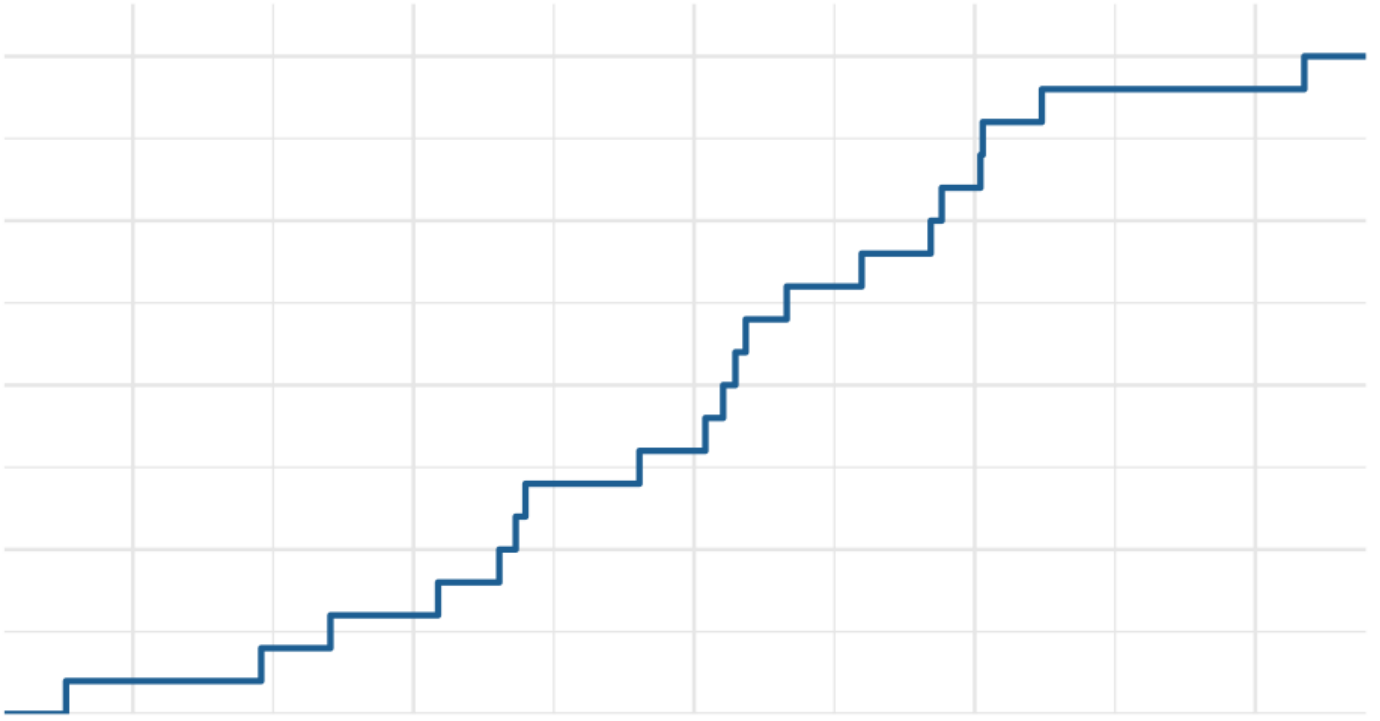
Histogram



Density plot

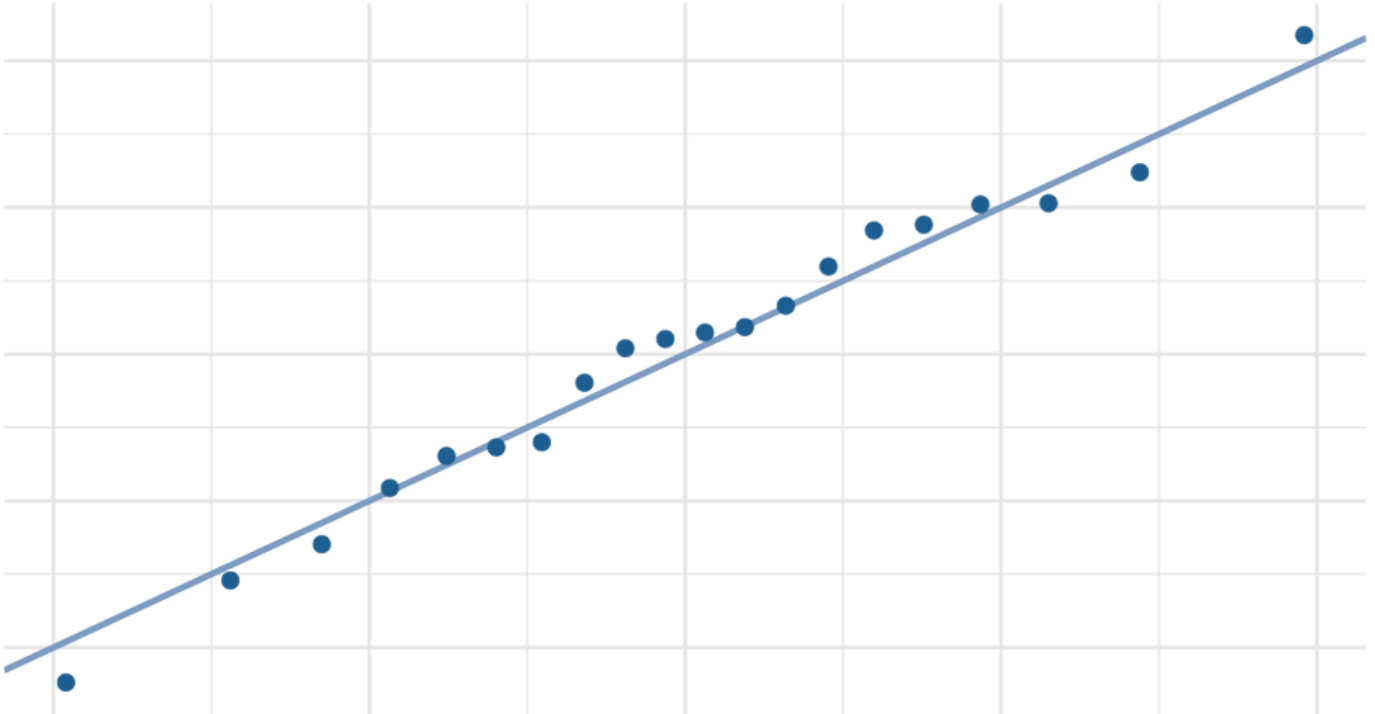


(Empirical) Cumulative Density



QQ Plot

Compare to theoretical quantiles (for normality)



Empirical examples

I'll move fast, but if you want to (try to) follow along, or recreate anything here later, first run

```
remotes::install_github("clauswilke/dviz.supp")
```

Titanic data

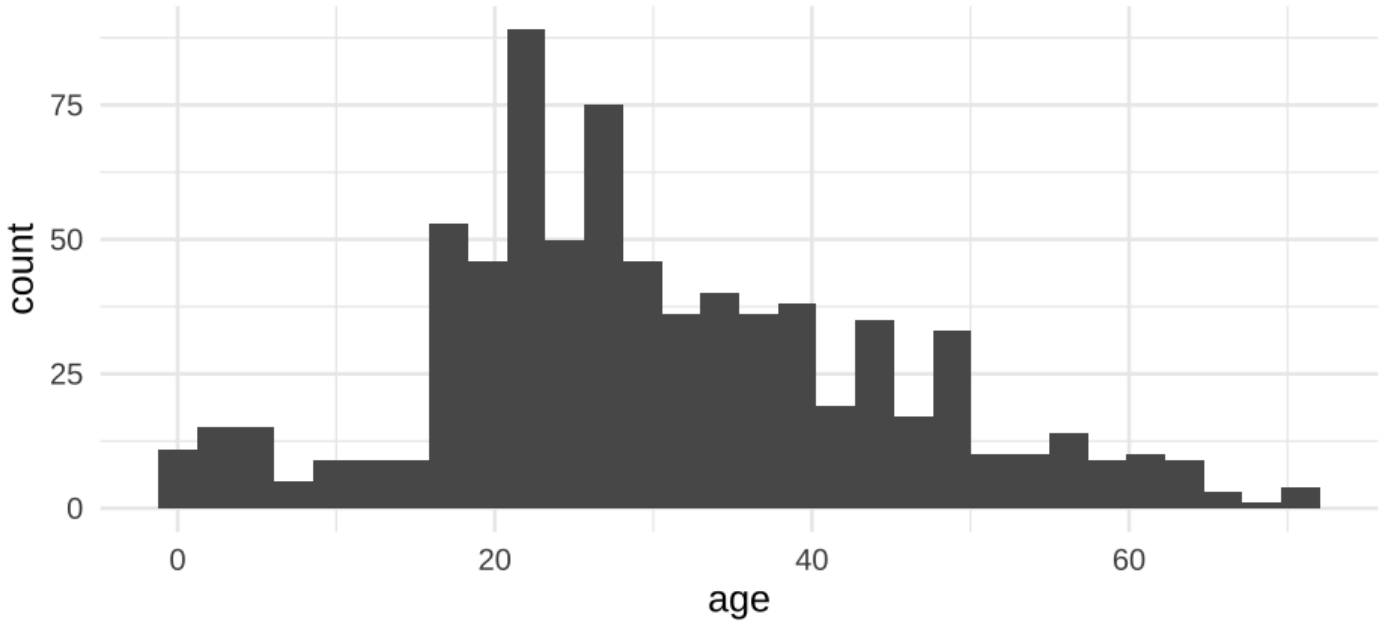
```
head(titanic)
```

```
##   class   age    sex survived
## 1   1st 29.00 female        1
## 2   1st  2.00 female        0
## 3   1st 30.00   male        0
## 4   1st 25.00 female        0
## 5   1st  0.92   male        1
## 6   1st 47.00   male        1
```

Basic histogram

```
ggplot(titanic, aes(x = age)) +
  geom_histogram()
```

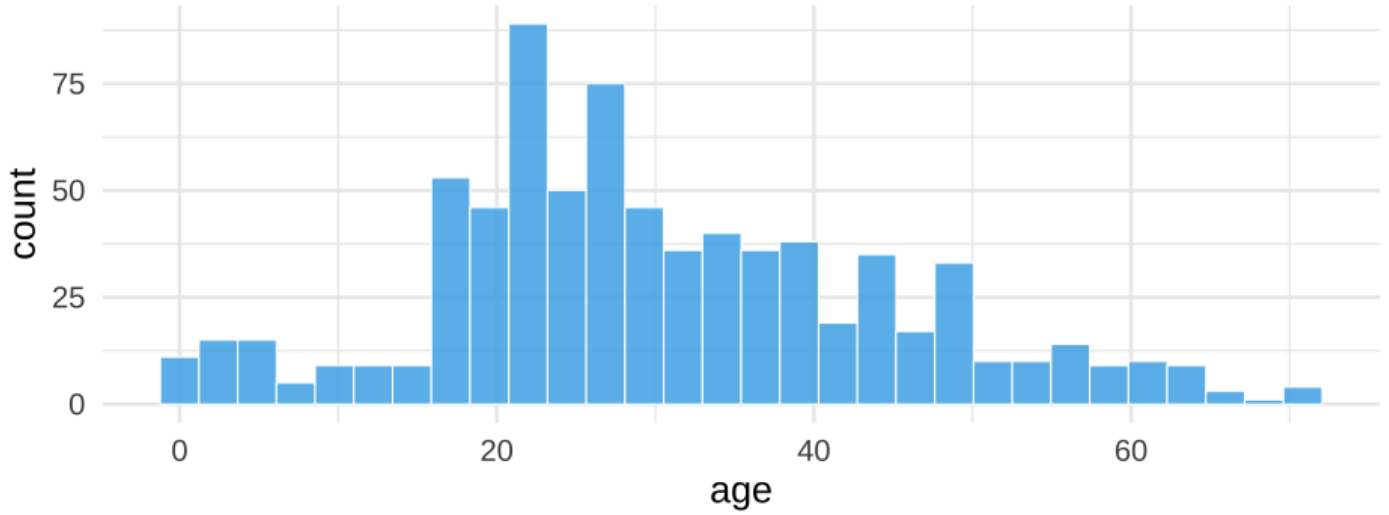
```
## `stat_bin()` using `bins = 30`. Pick better value with `binwidth`.
```



Make it a little prettier

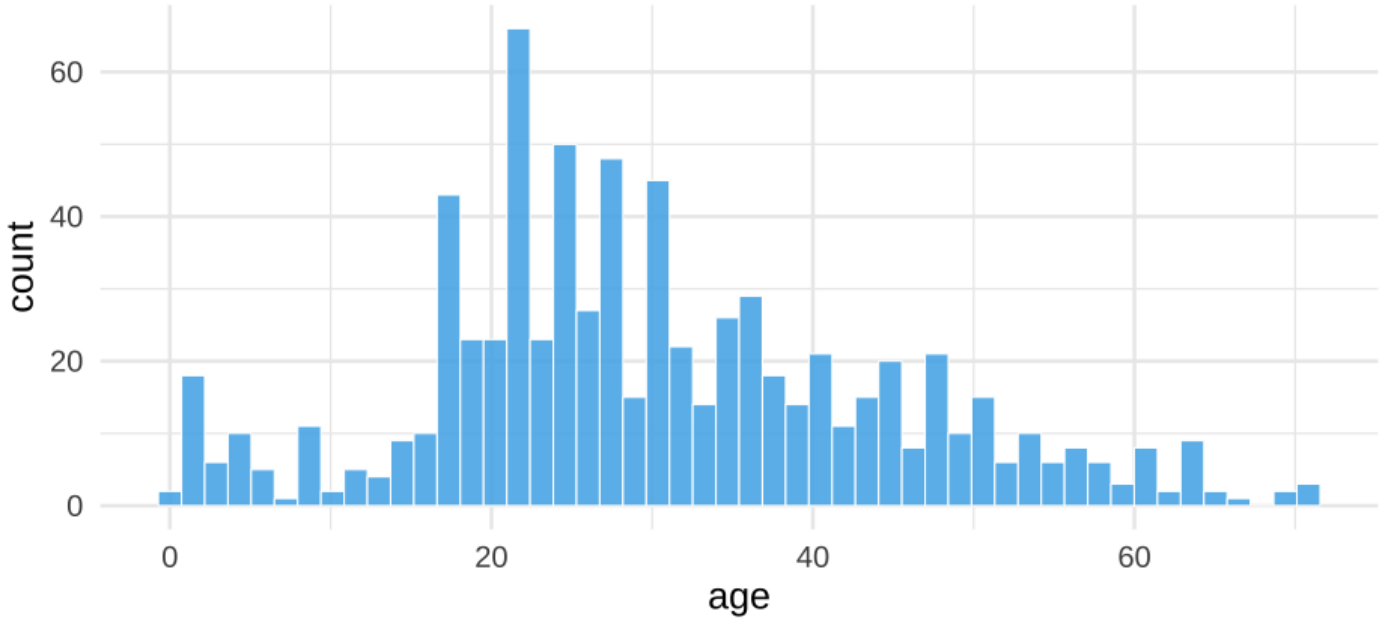
```
ggplot(titanic, aes(x = age)) +
  geom_histogram(fill = "#56B4E9",
                 color = "white",
                 alpha = 0.9)
```

```
## `stat_bin()` using `bins = 30`. Pick better value with `binwidth`.
```

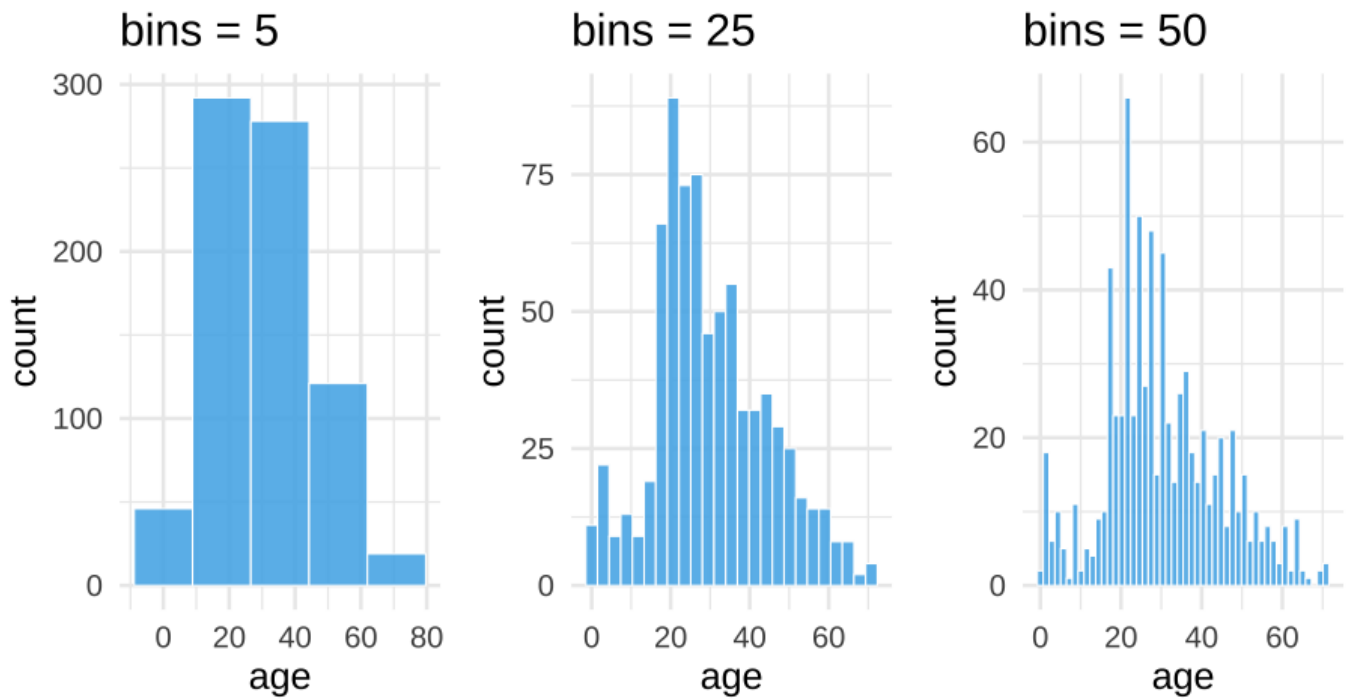


Change the number of bins

```
ggplot(titanic, aes(x = age)) +
  geom_histogram(fill = "#56B4E9",
                 color = "white",
                 alpha = 0.9,
                 bins = 50)
```



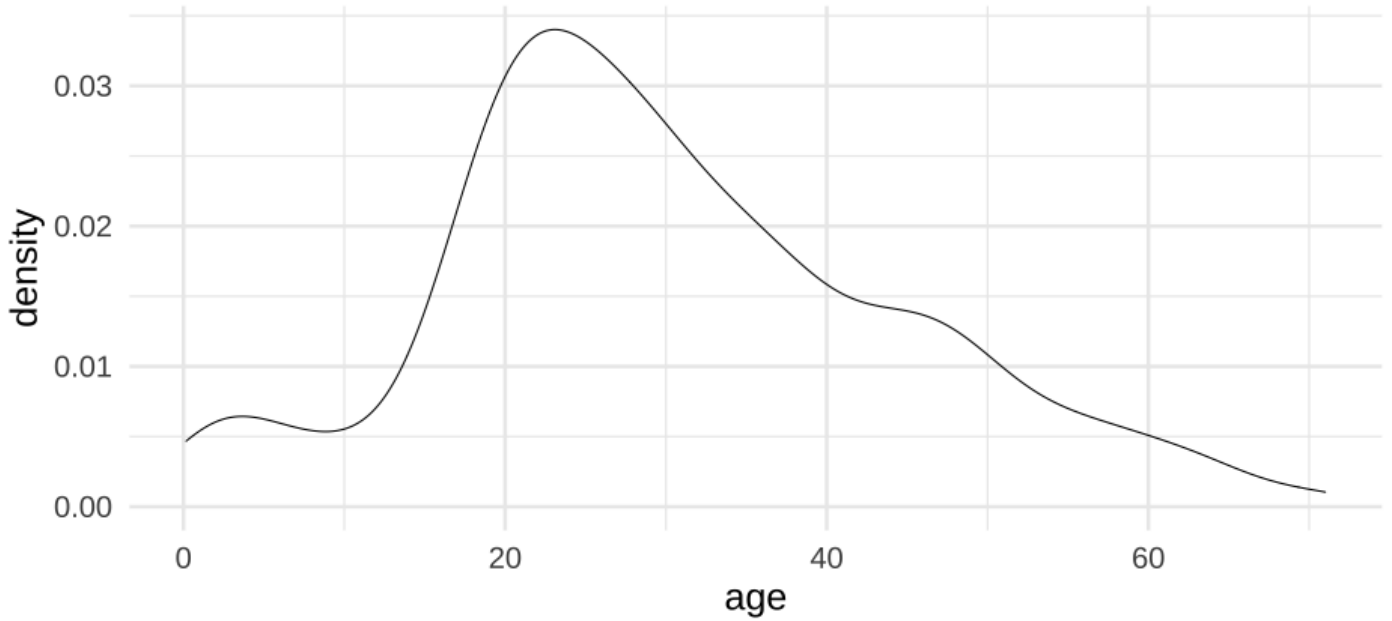
Vary the number of bins



Denisty plot

ugly 😫

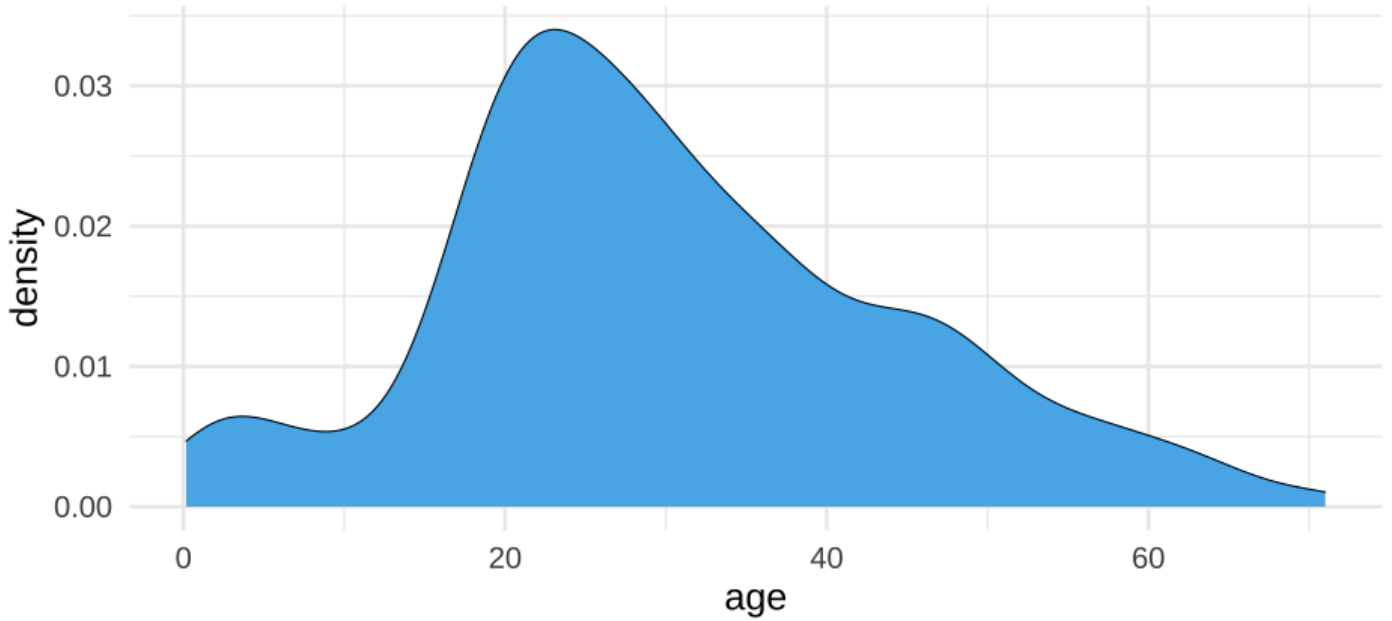
```
ggplot(titanic, aes(age)) +
  geom_density()
```



Denisty plot

Change the fill 😌

```
ggplot(titanic, aes(age)) +
  geom_density(fill = "#56B4E9")
```



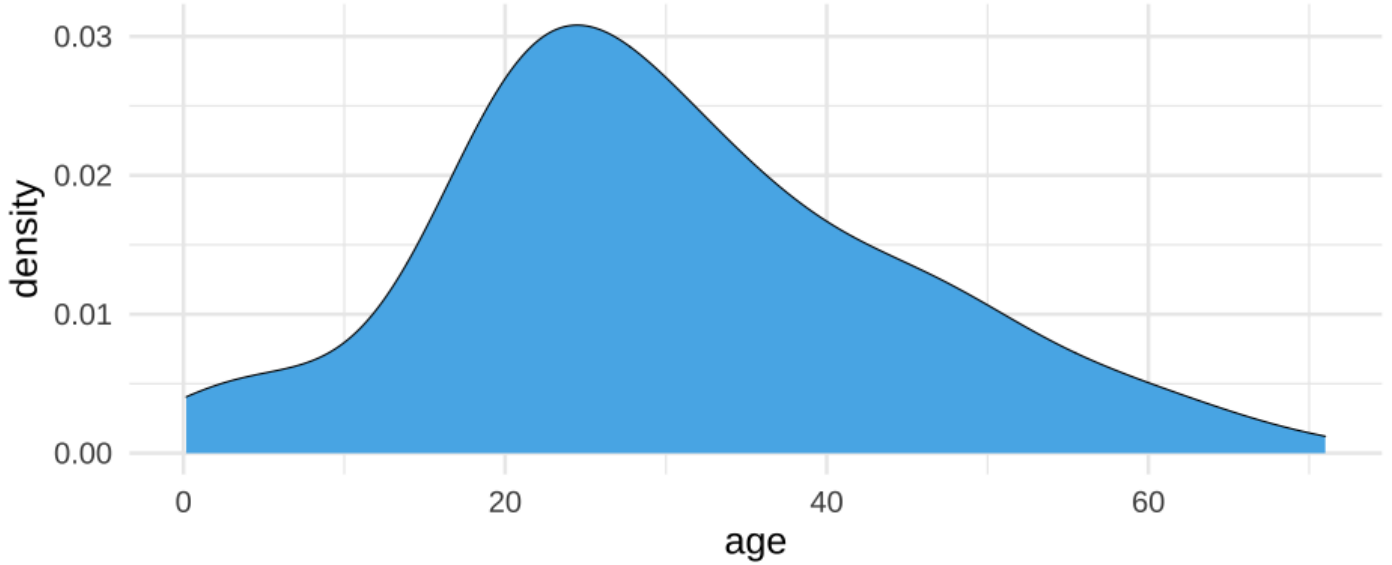
Density plot estimation

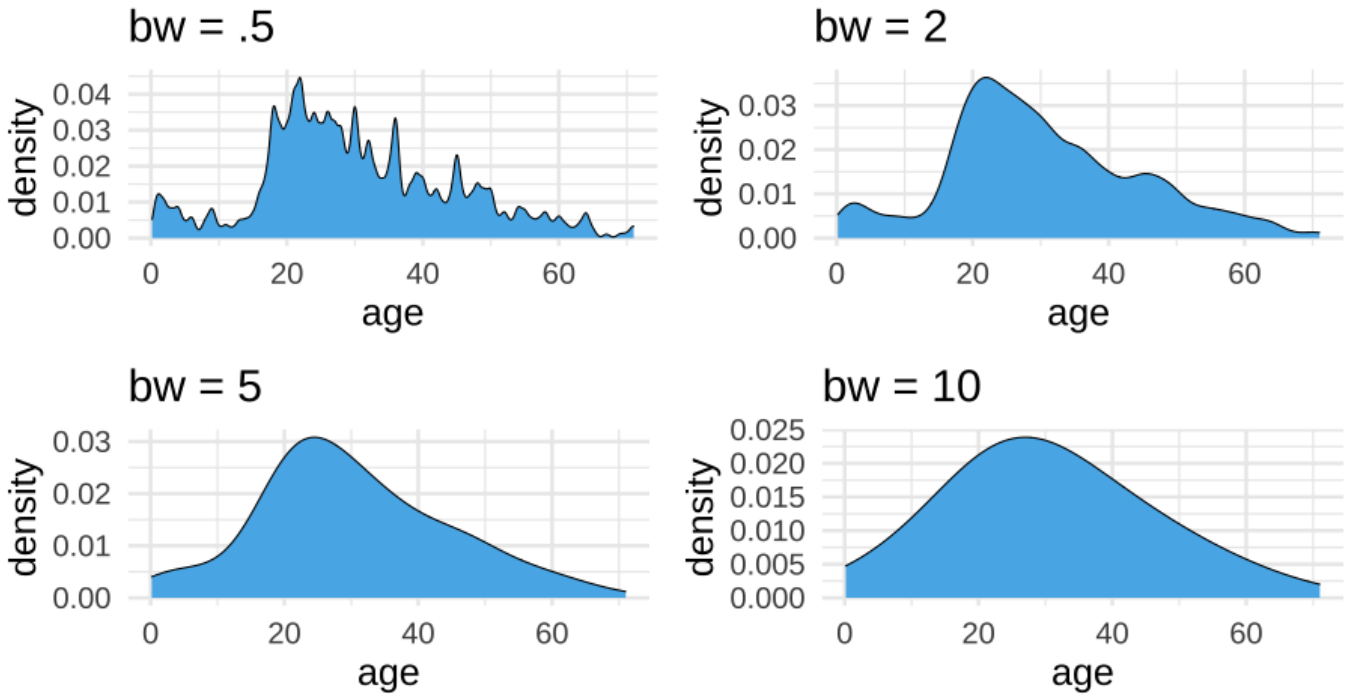
- Kernal density estimation
    - Different kernal shapes can be selected
    - Bandwidth matters most
    - Smaller bands = bend more to the data
- Approximation of the underlying continuous probability function
    - Integrates to 1.0 (y–axis is somewhat difficult to interpret)

Denisty plot

change the bandwidth

```
ggplot(titanic, aes(age)) +
  geom_density(fill = "#56B4E9",
               bw = 5)
```





bw = .5

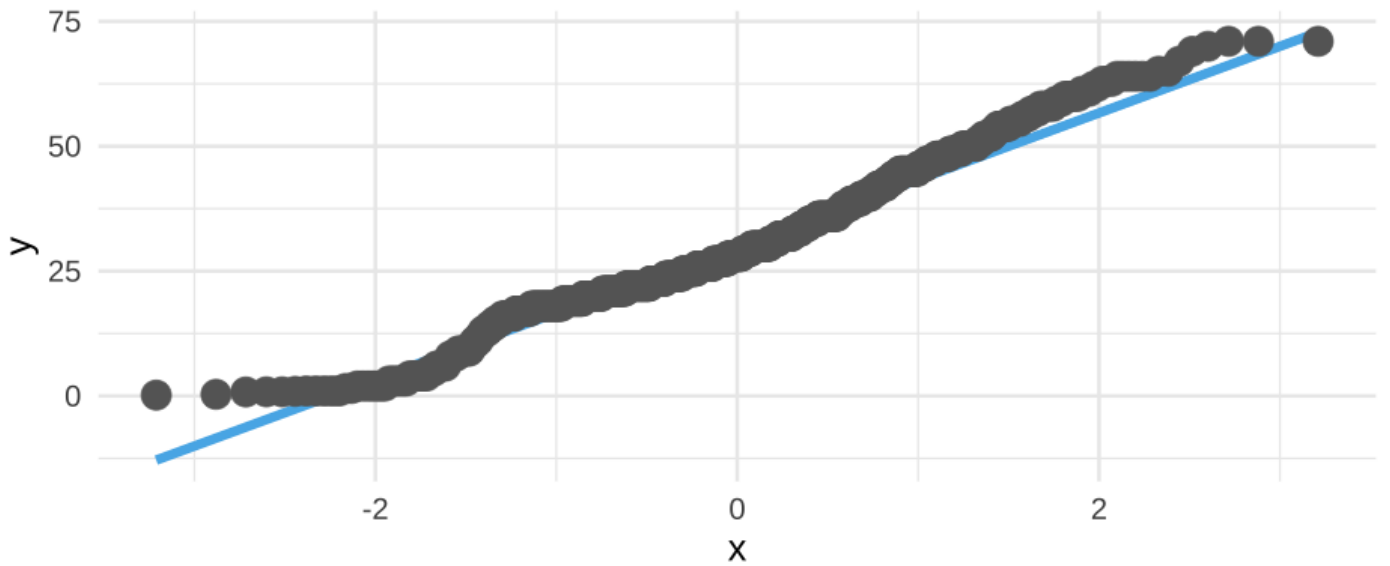
Quickly

How well does it approximate a normal distribution?

```
ggplot(titanic, aes(sample = age)) +
  stat_qq_line(color = "#56B4E9") +
  geom_qq(color = "gray40")
```



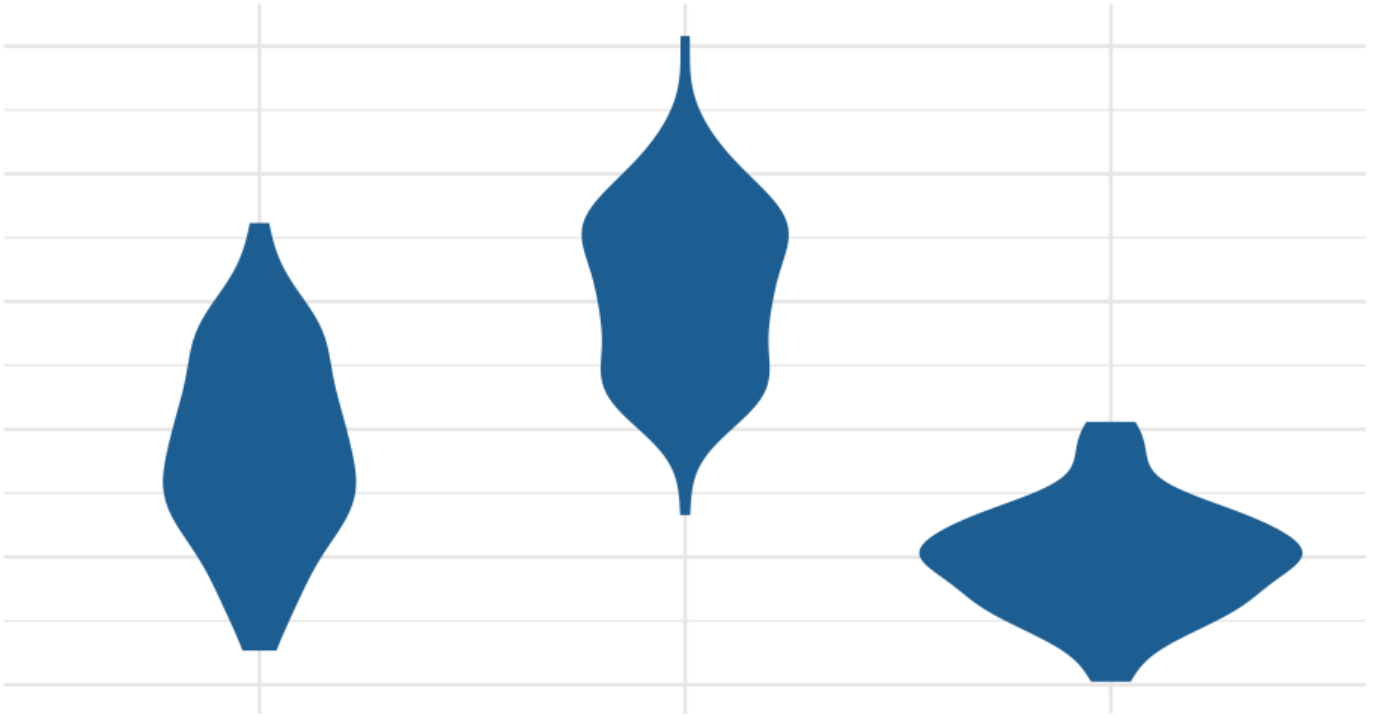
Grouped data

Distributions

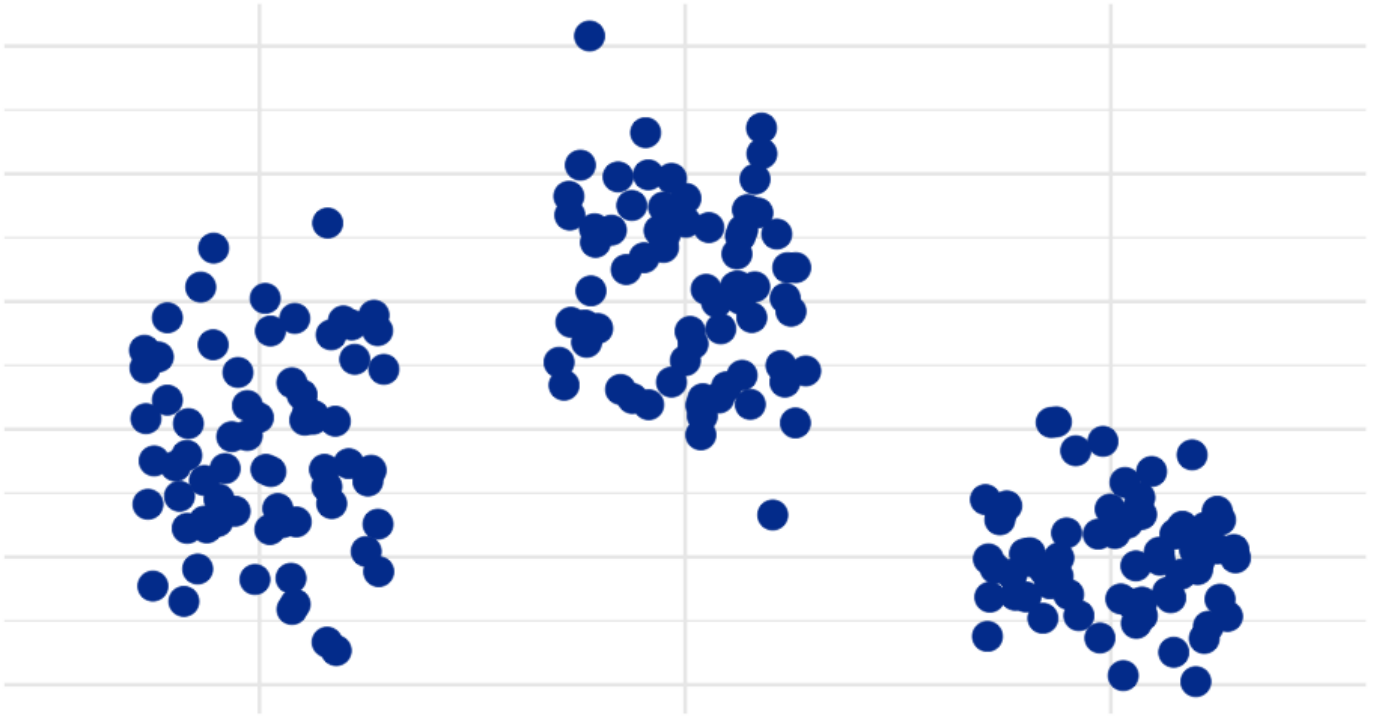
How do we display more than one distribution at a time?

Boxplots

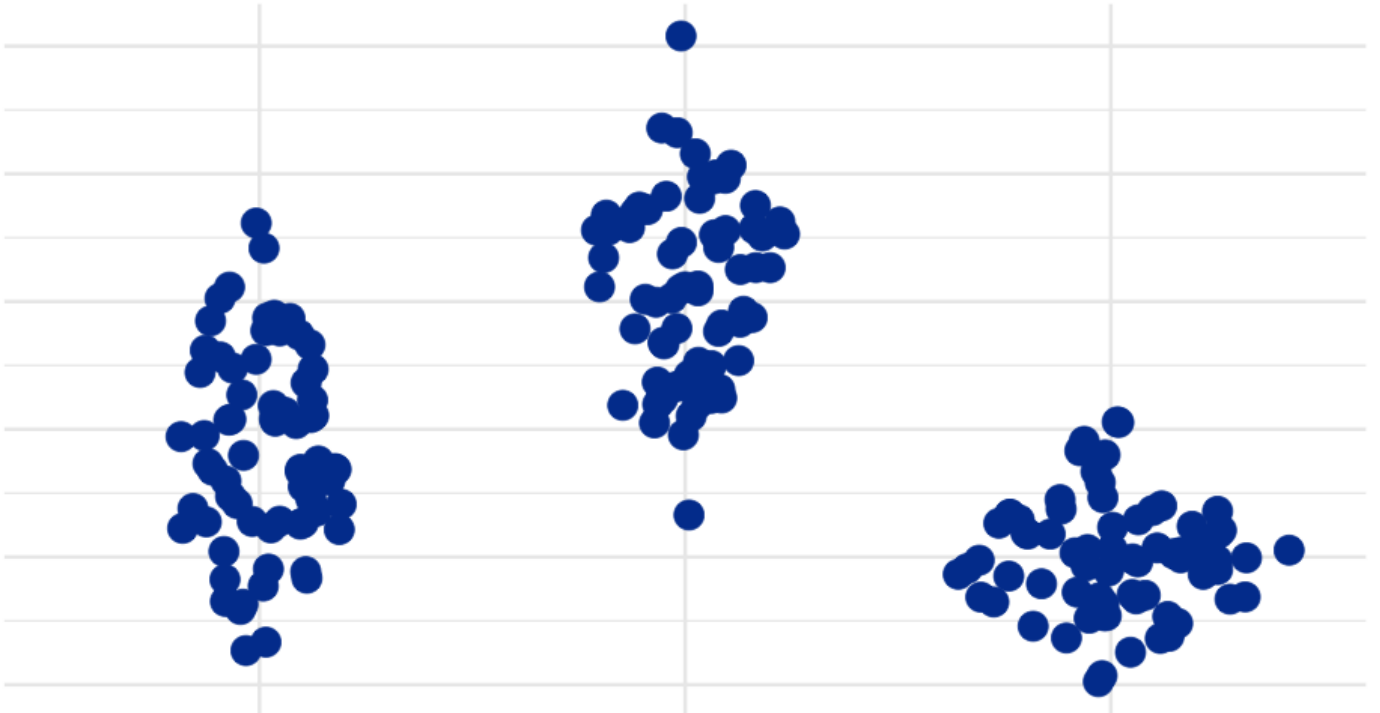
Violin plots



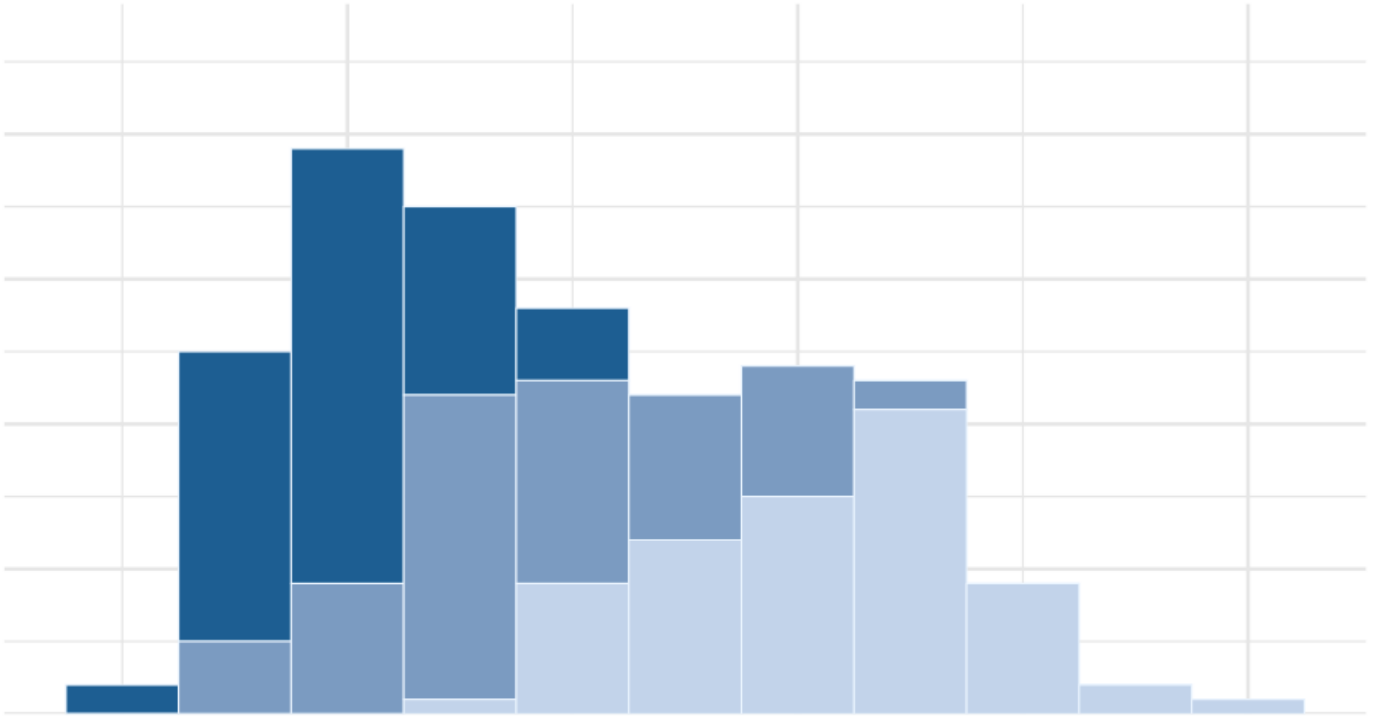
Jittered points



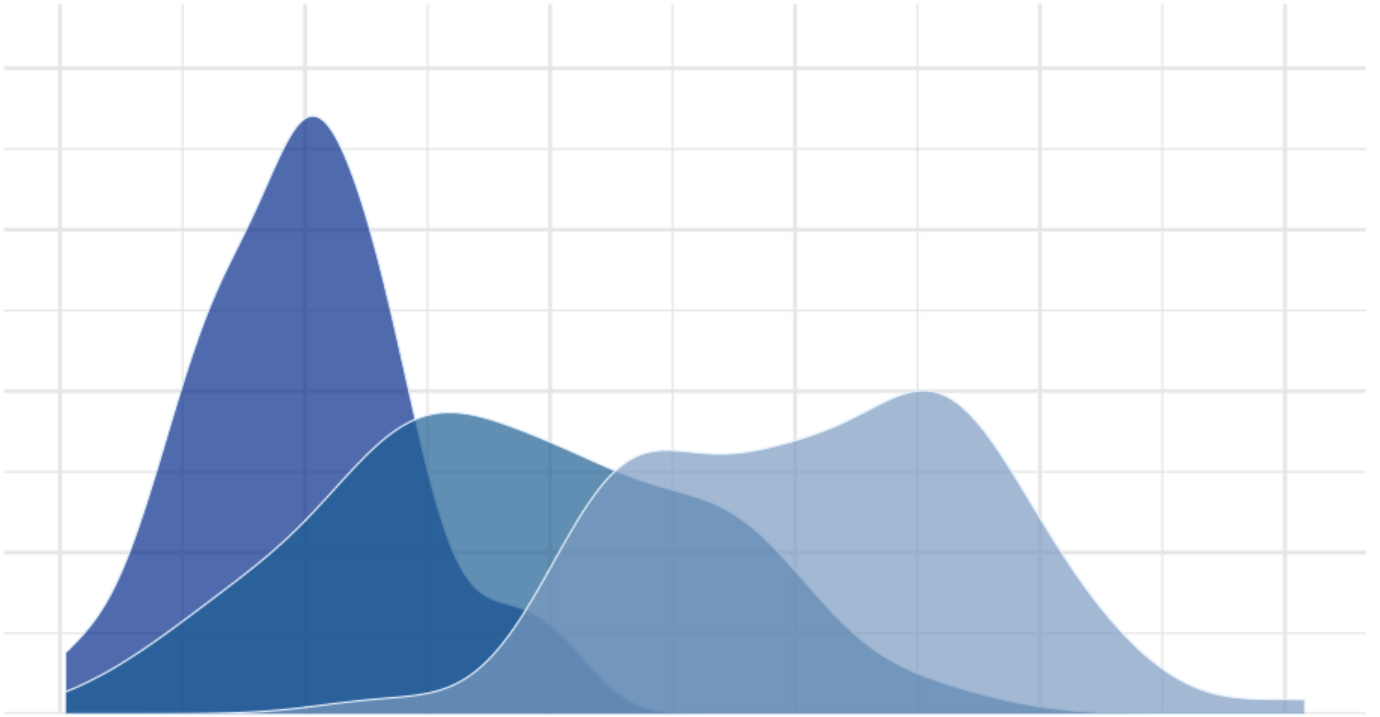
Sina plots



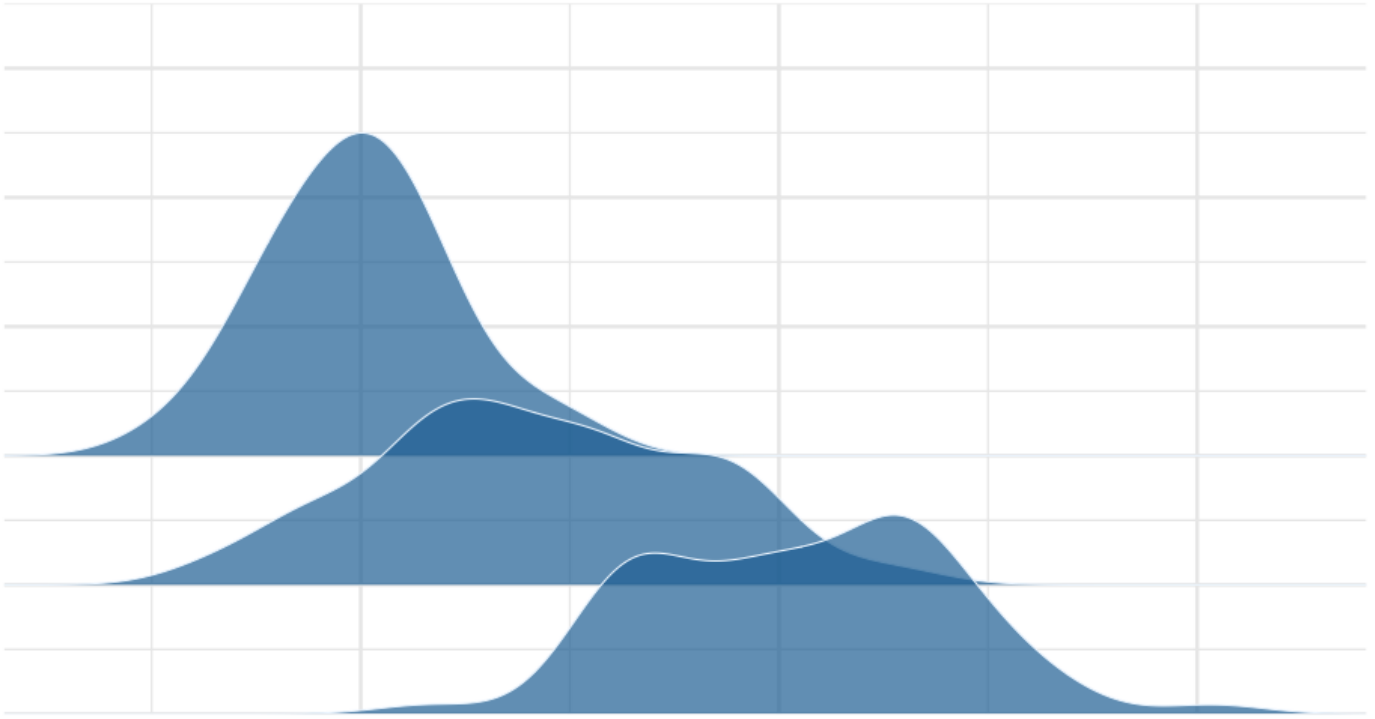
Stacked histograms



Overlapping densities



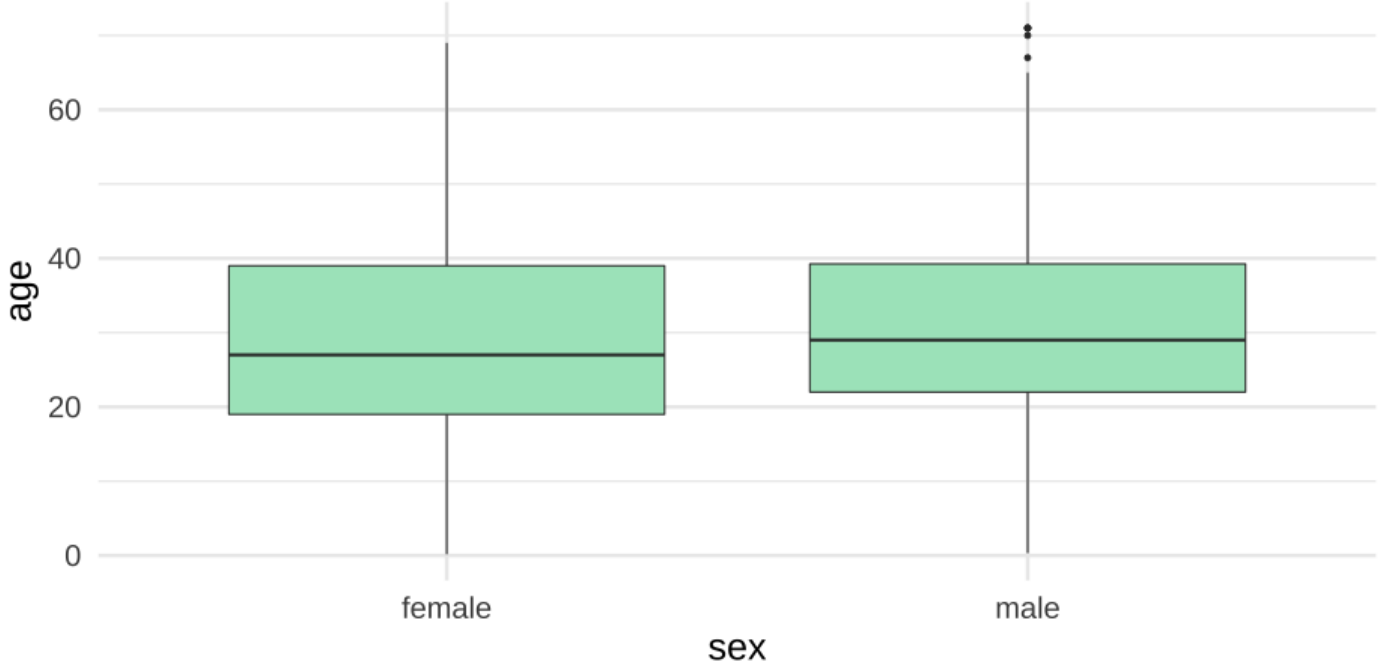
Ridgeline densities



Quick empirical examples

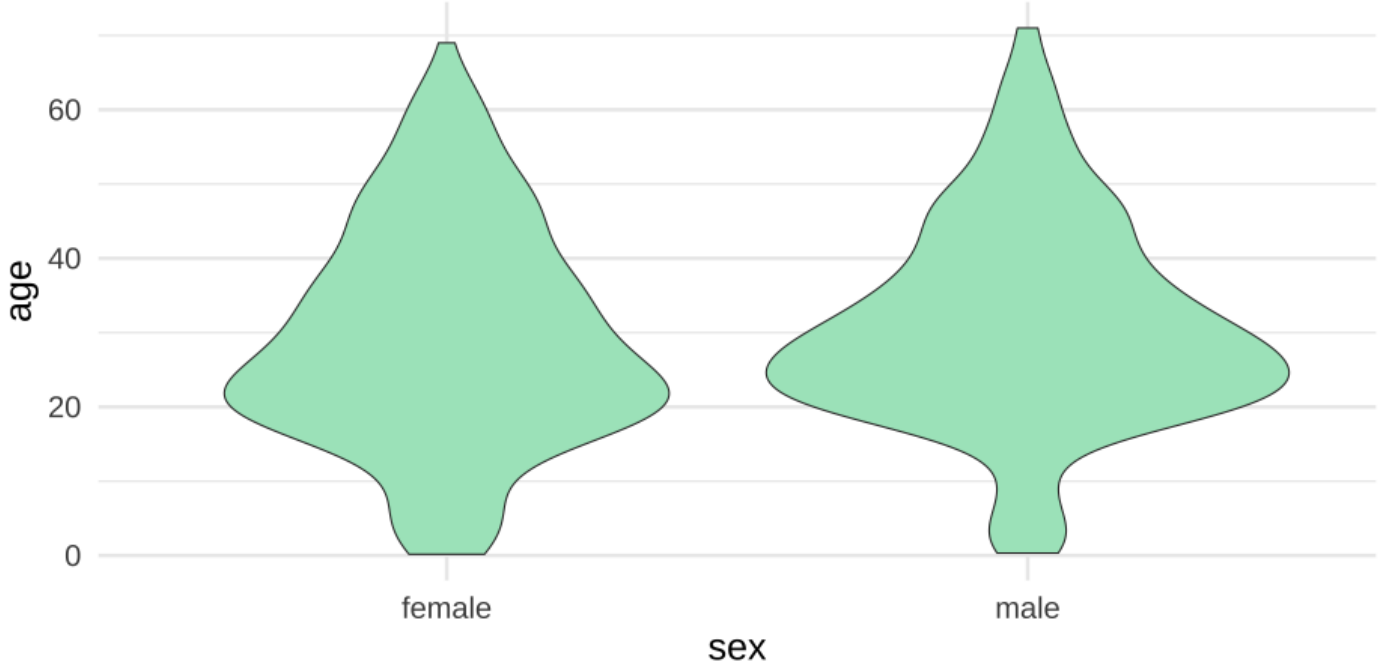
Boxplots

```
ggplot(titanic, aes(sex, age)) +
  geom_boxplot(fill = "#A9E5C5")
```



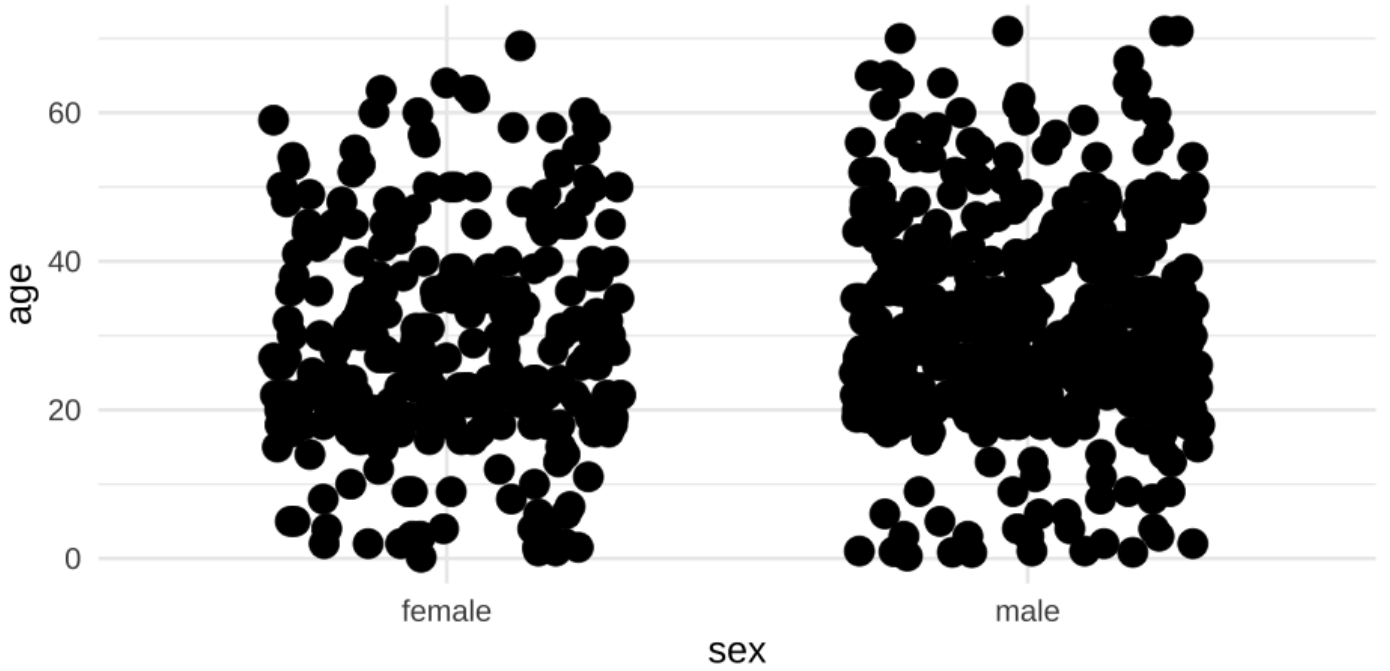
Violin plots

```
ggplot(titanic, aes(sex, age)) +
  geom_violin(fill = "#A9E5C5")
```



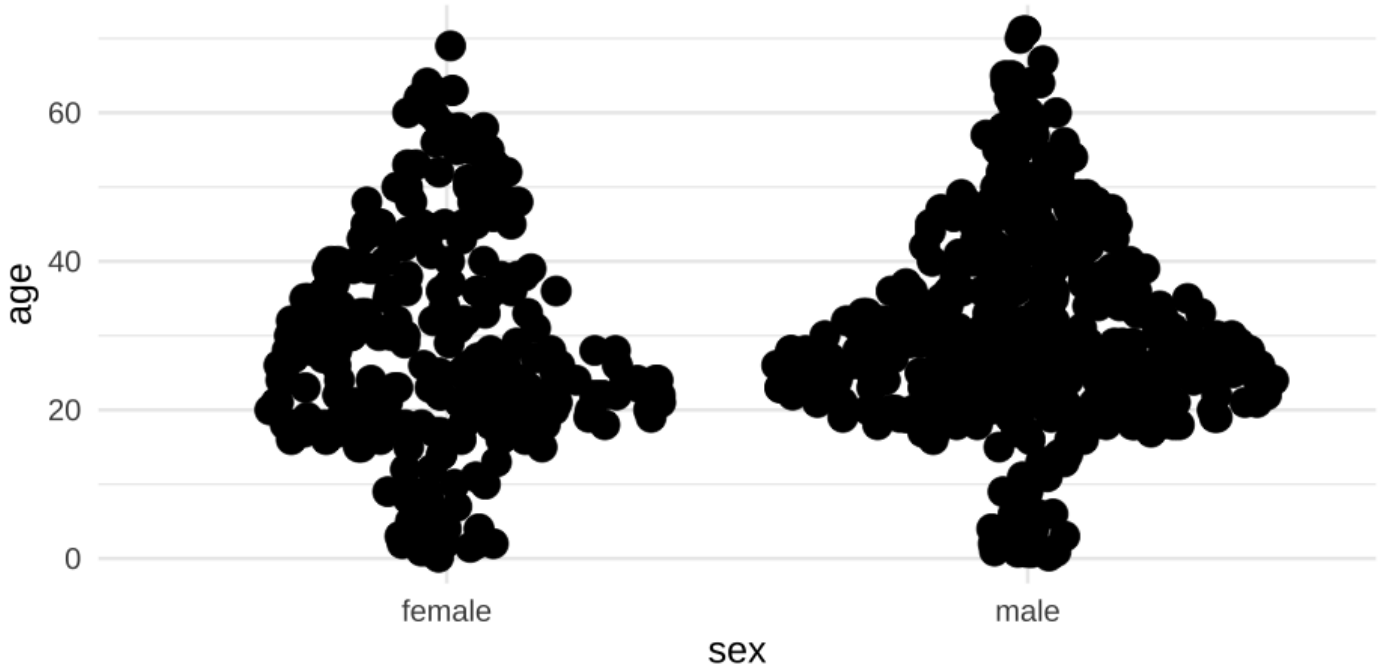
Jittered point plots

```
ggplot(titanic, aes(sex, age)) +
  geom_jitter(width = 0.3, height = 0)
```



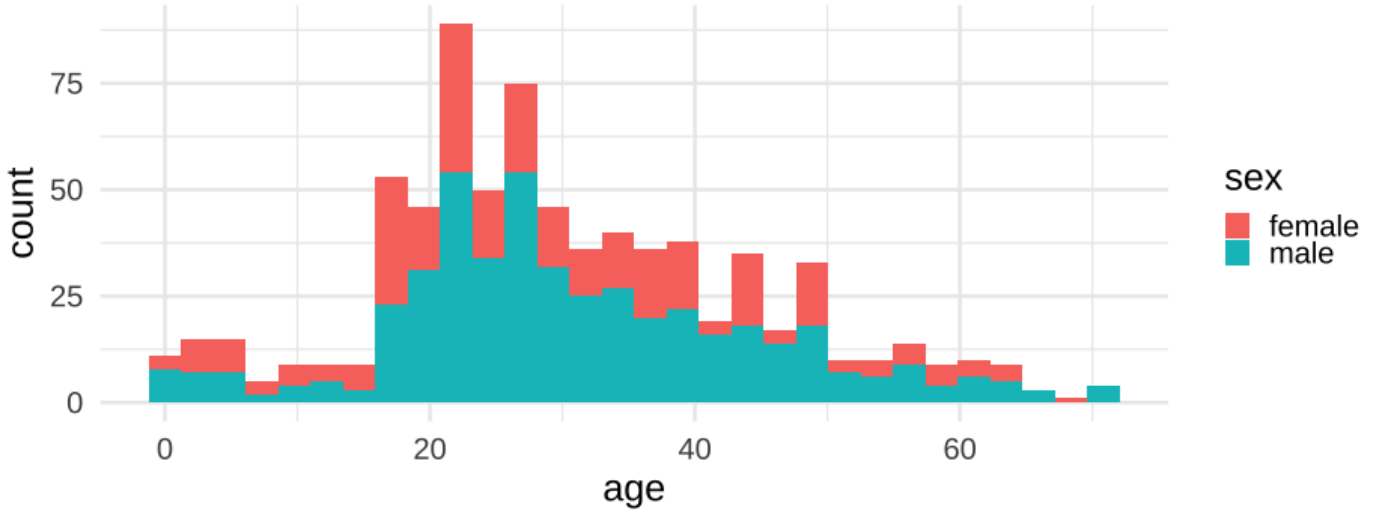
Sina plot

```
ggplot(titanic, aes(sex, age)) +
  ggforce::geom_sina()
```



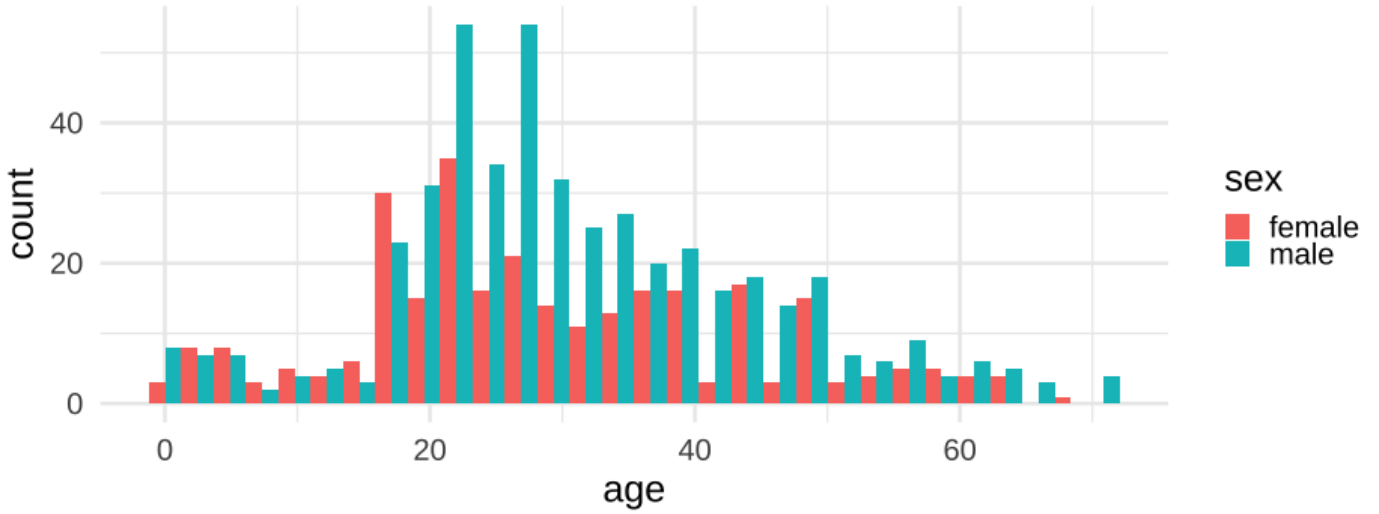
Stacked histogram

```
ggplot(titanic, aes(age)) +
  geom_histogram(aes(fill = sex))
```



Dodged

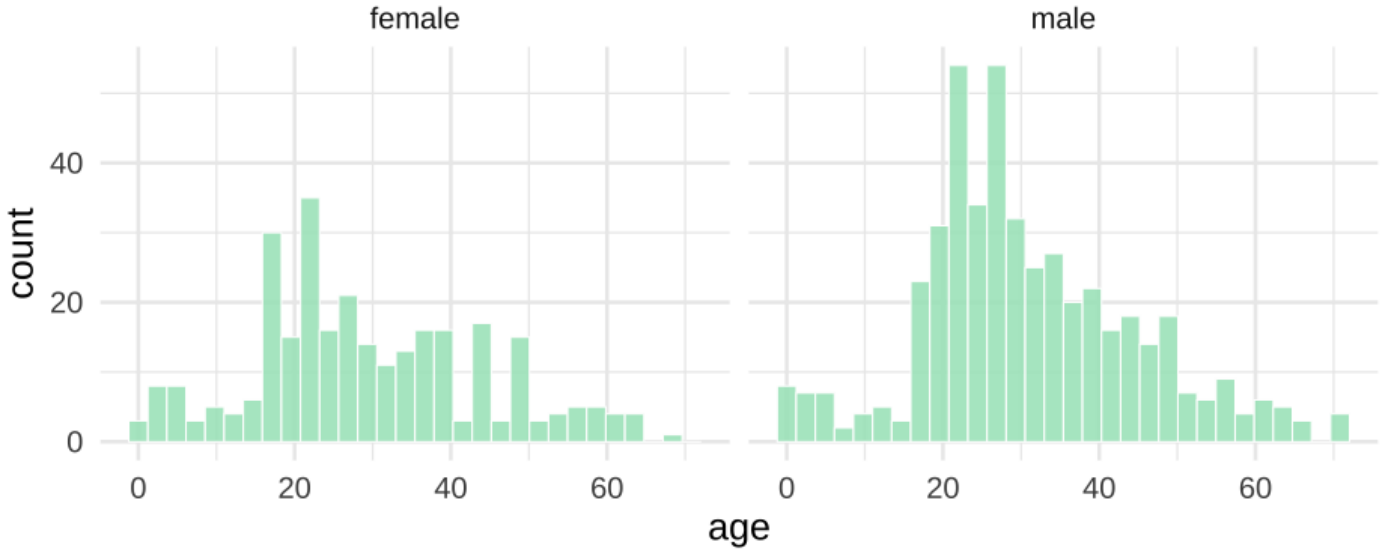
```
ggplot(titanic, aes(age)) +
  geom_histogram(aes(fill = sex),
                 position = "dodge")
```



Note `position = "dodge"` does not go into `aes` (not accessing a variable in your dataset)

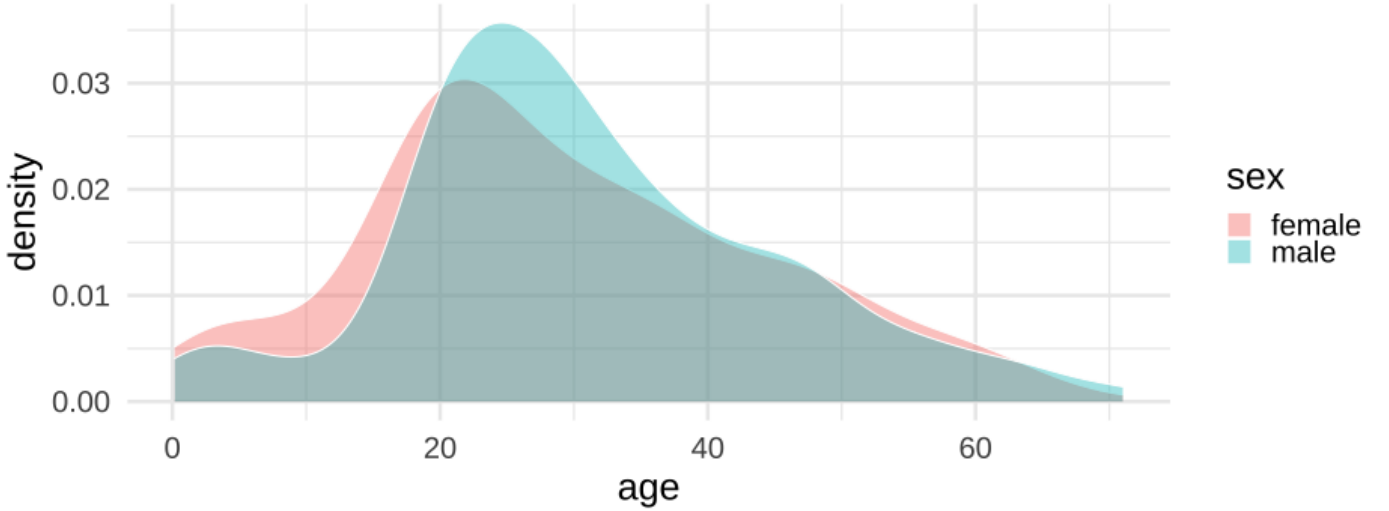
Better

```
ggplot(titanic, aes(age)) +
  geom_histogram(fill = "#A9E5C5",
                 color = "white",
                 alpha = 0.9,) +
  facet_wrap(~sex)
```



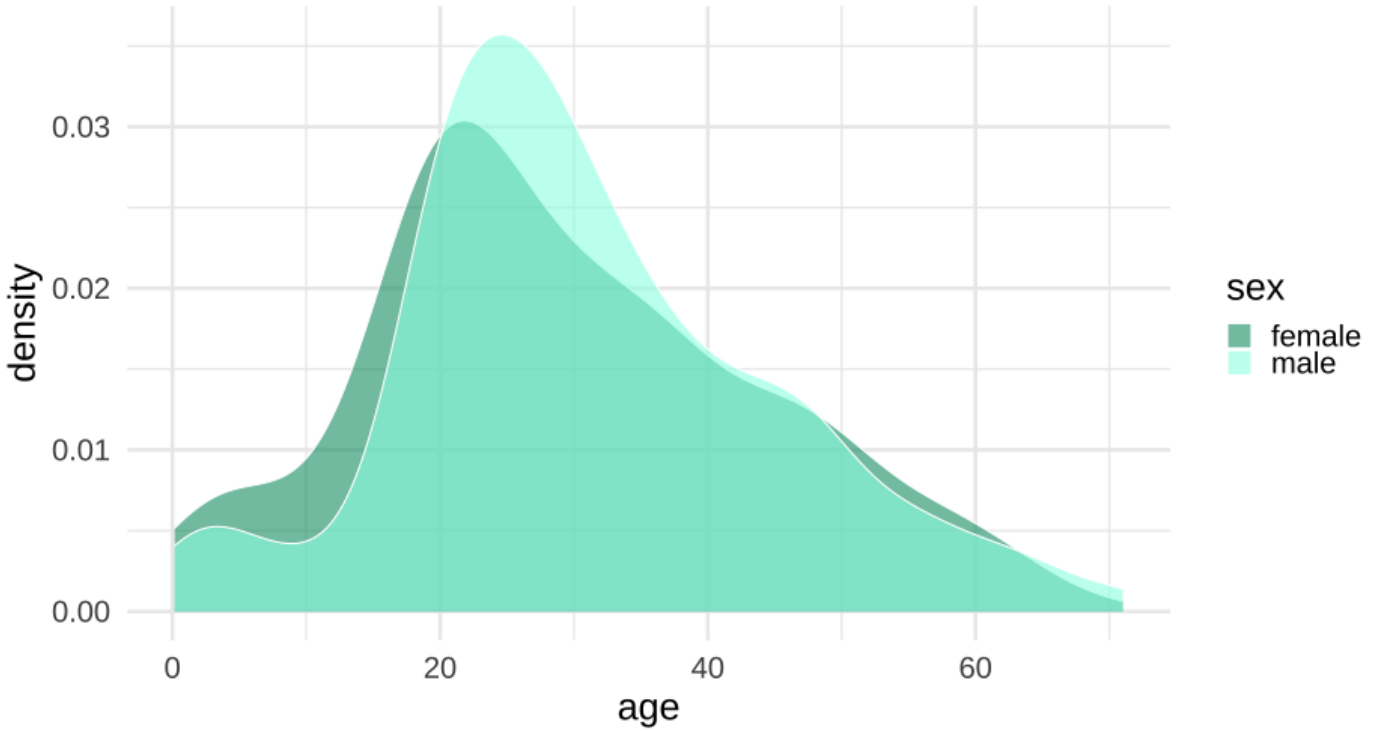
Overlapping densities

```
ggplot(titanic, aes(age)) +
  geom_density(aes(fill = sex),
               color = "white",
               alpha = 0.4)
```



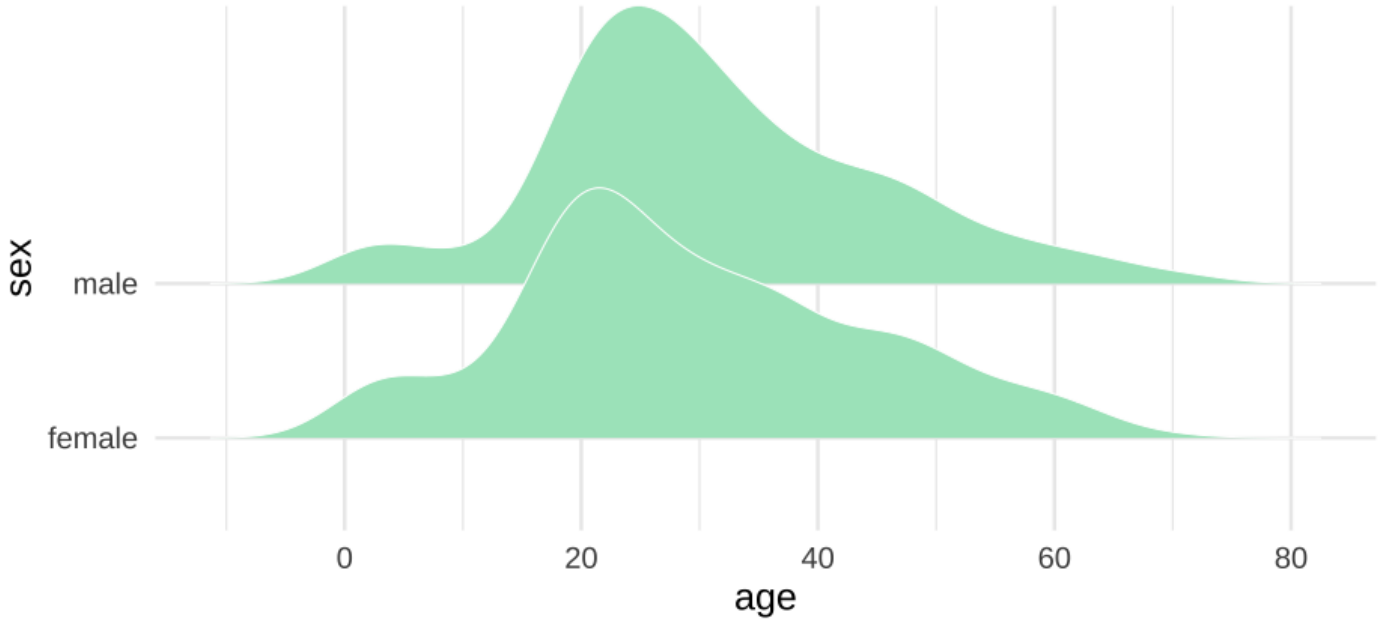
Note the default colors really don't work well in most of these

```
ggplot(titanic, aes(age)) +
  geom_density(aes(fill = sex),
               color = "white",
               alpha = 0.6) +
  scale_fill_manual(values = c("#009973", "#99ffe6"))
```



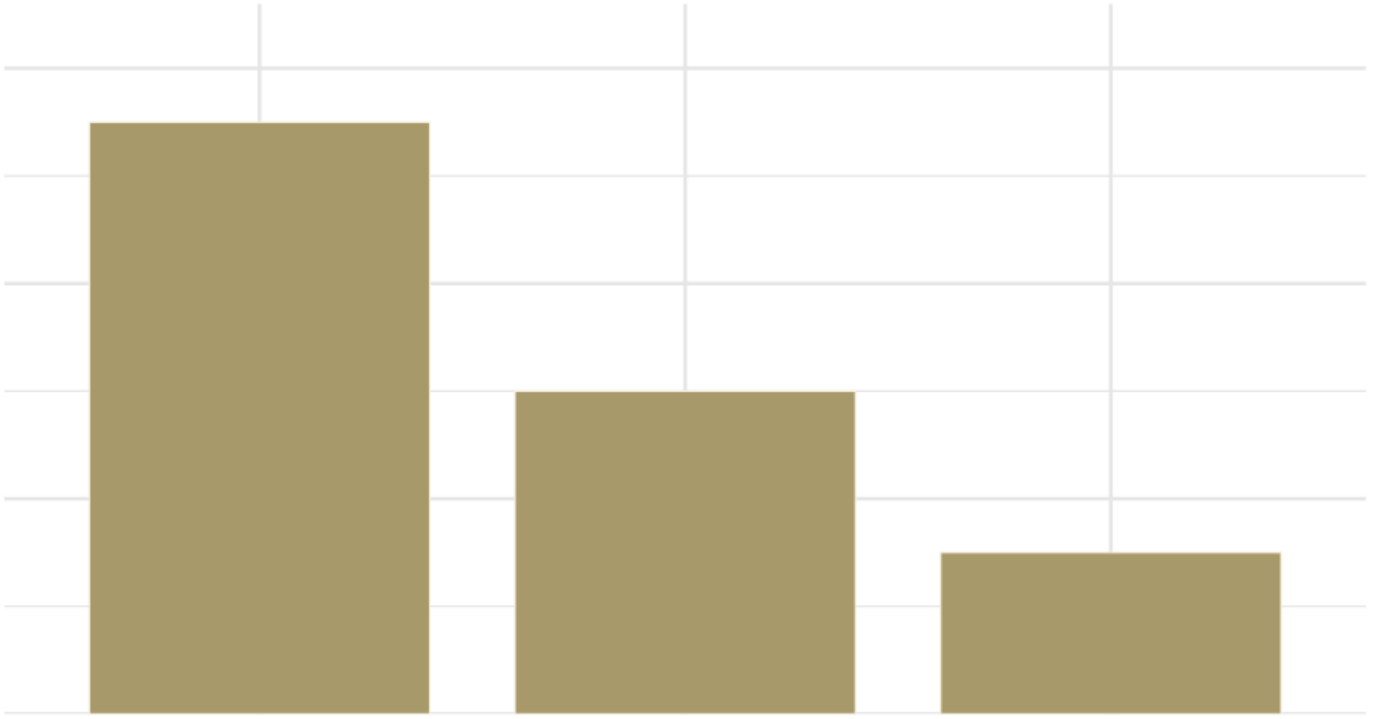
Ridgeline densities

```
ggplot(titanic, aes(age, sex)) +
  ggridges::geom_density_ridges(color = "white",
                                fill = "#A9E5C5")
```

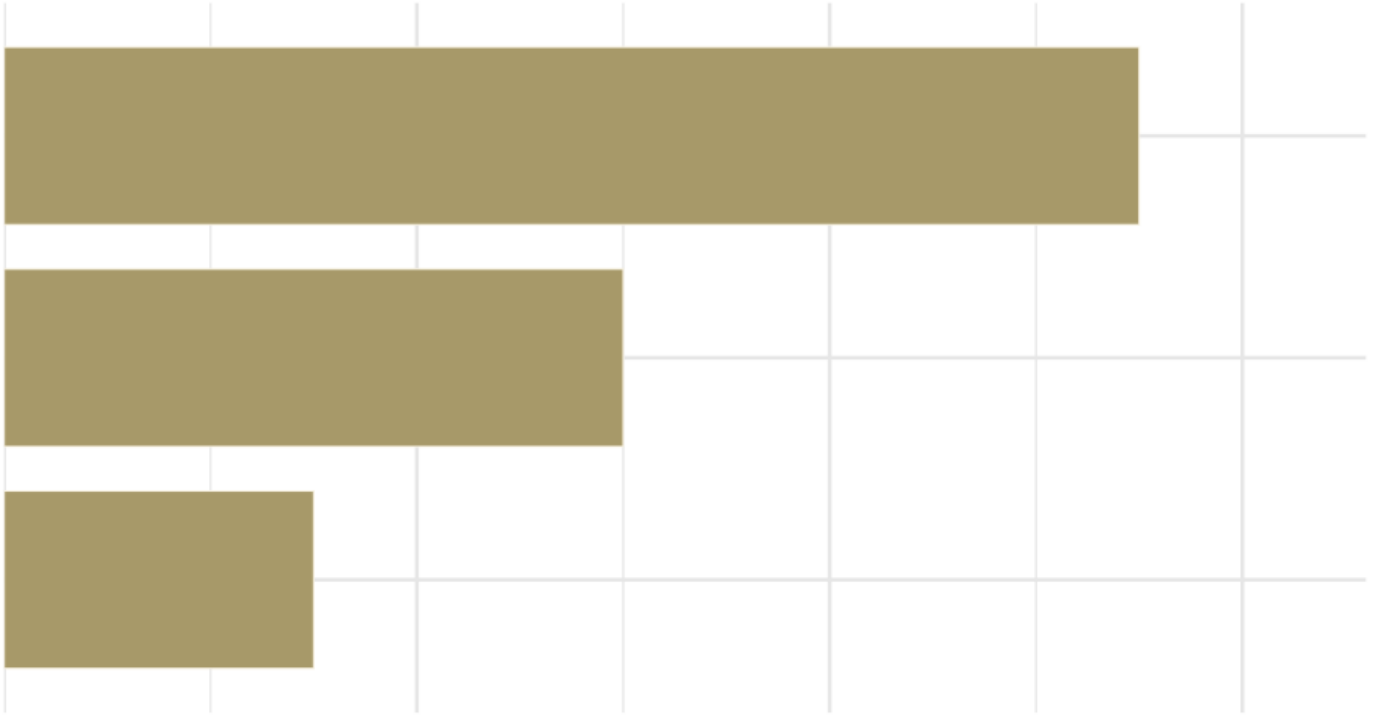


Visualizing amounts

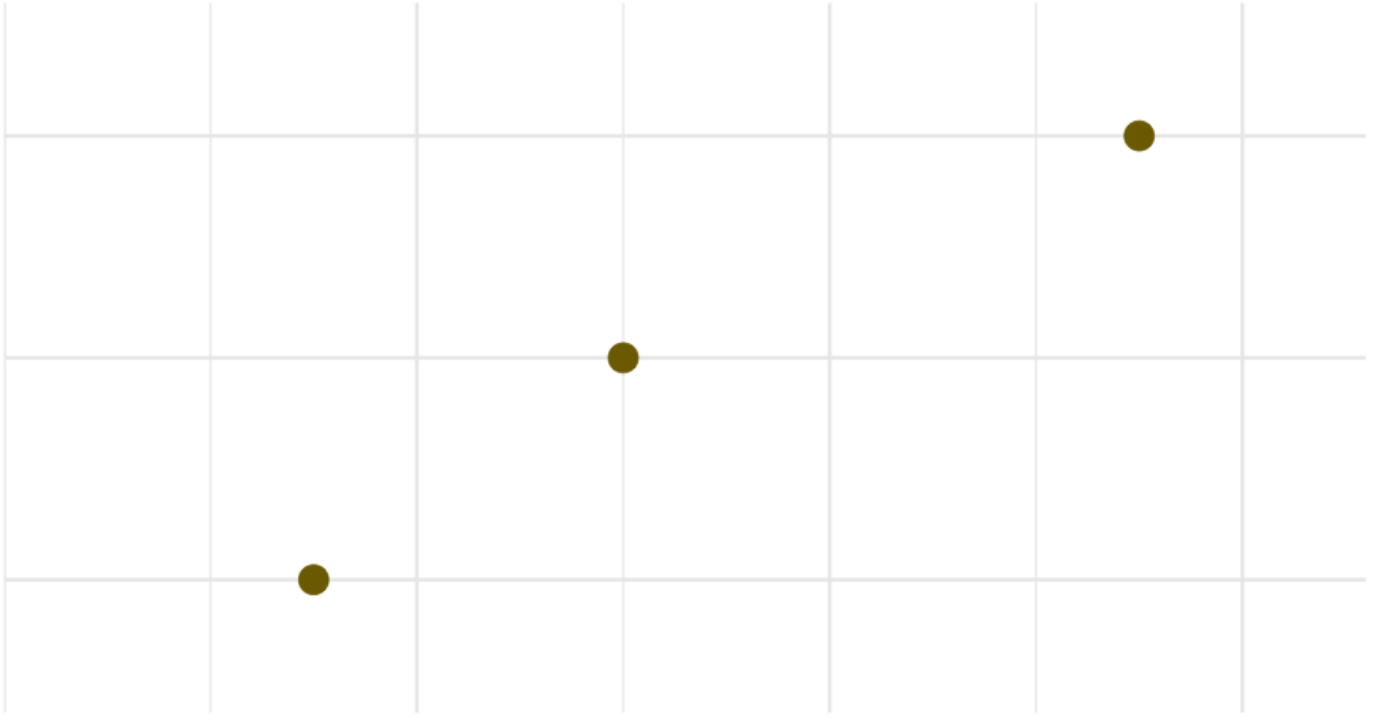
Bar plots



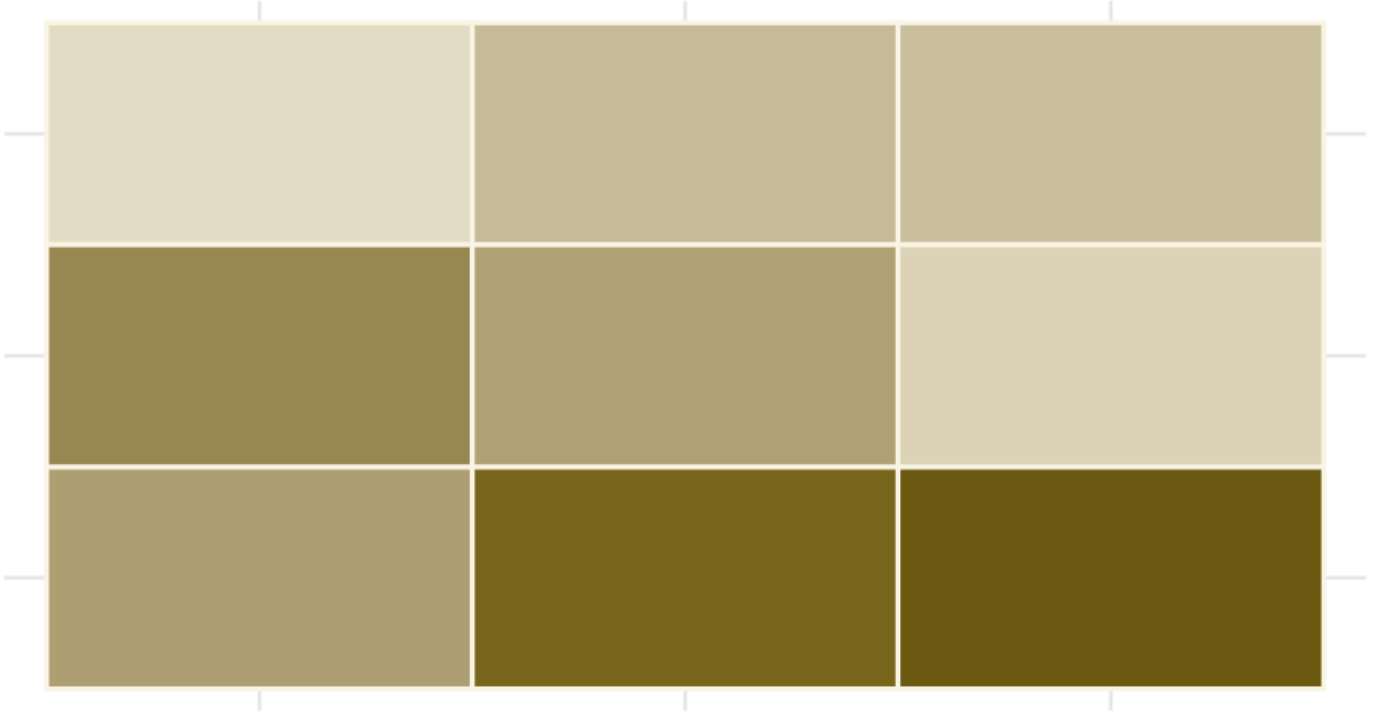
Flipped bars



Dotplot



Heatmap



Empirical examples

How much does college cost?

```
library(here)
library(rio)
tuition <- import(here("data", "us_avg_tuition.xlsx"),
                  setclass = "tbl_df")
head(tuition)
```

```
## # A tibble: 6 x 13

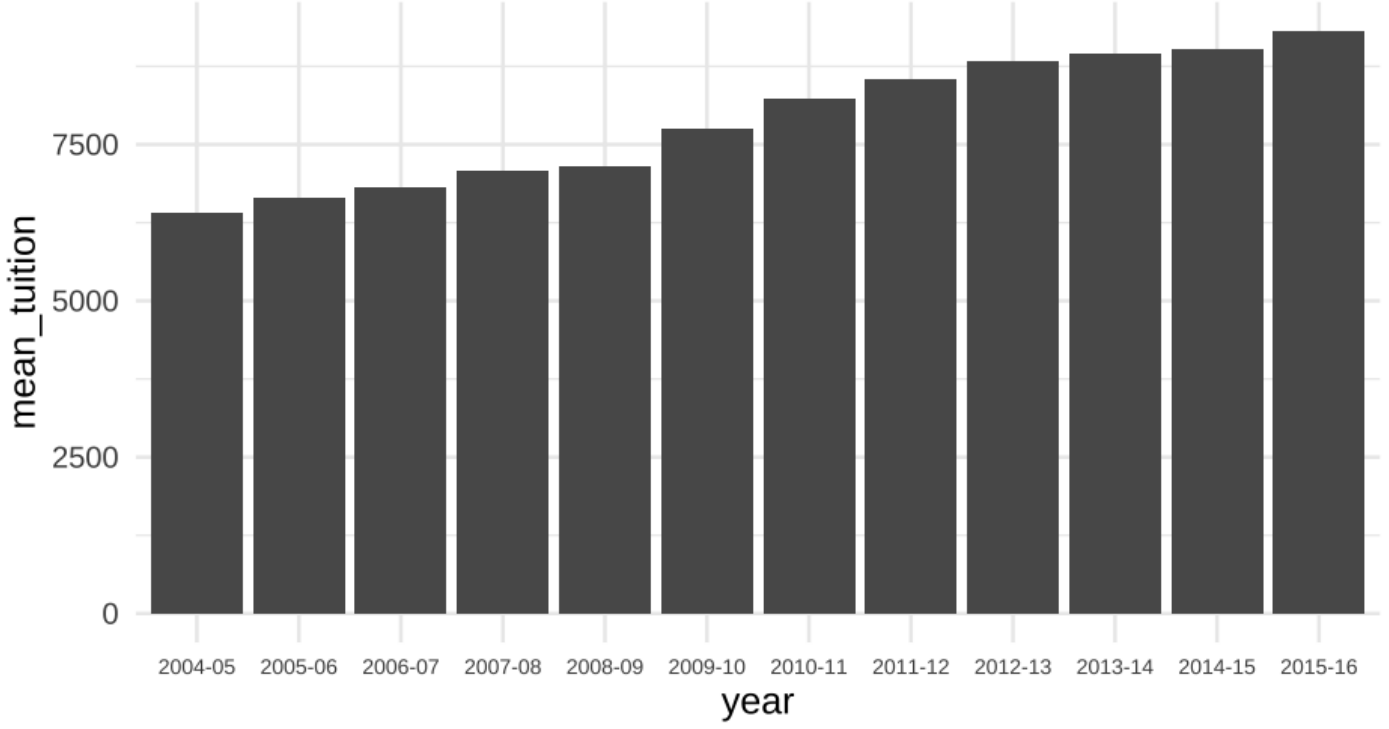
##  9 2012-13     8842.357
## 10 2013-14     8947.938
## 11 2014-15     9037.357
## 12 2015-16     9317.633
```

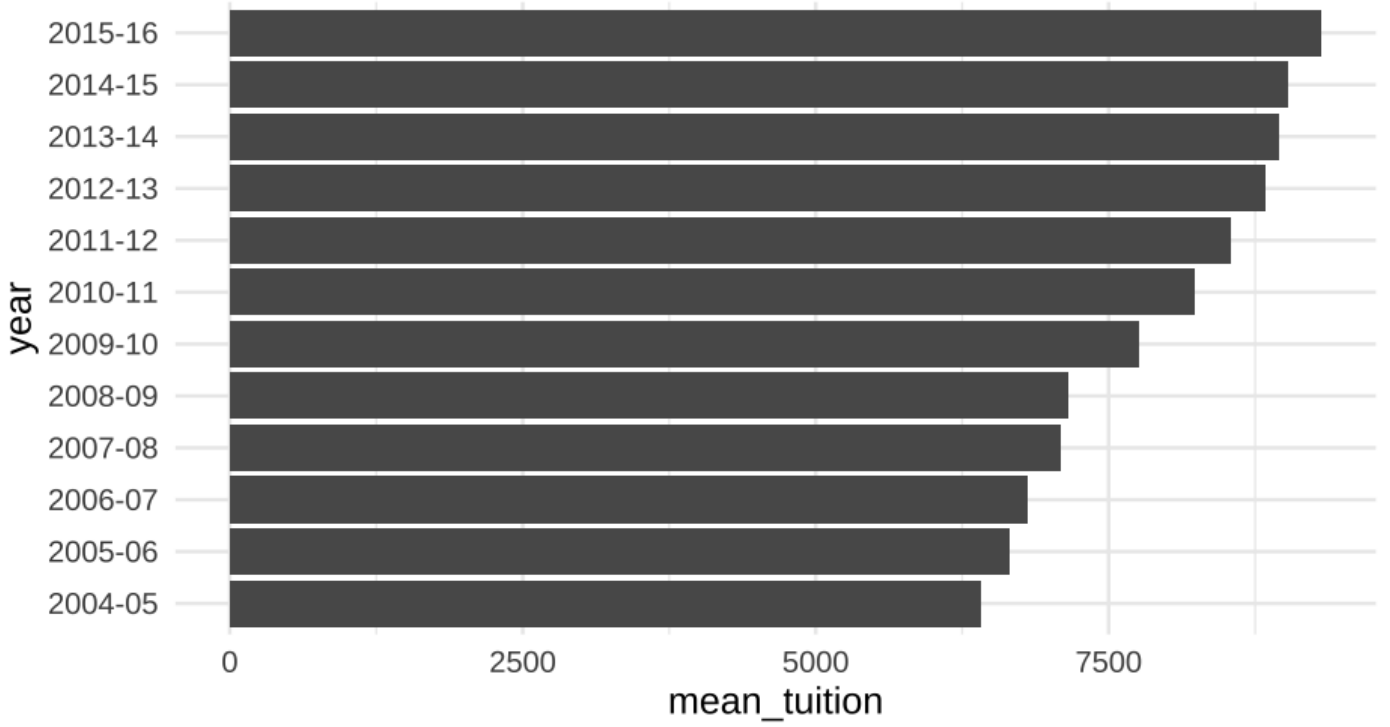
Good

```
ggplot(annual_means, aes(year, mean_tuition)) +
  geom_col()
```



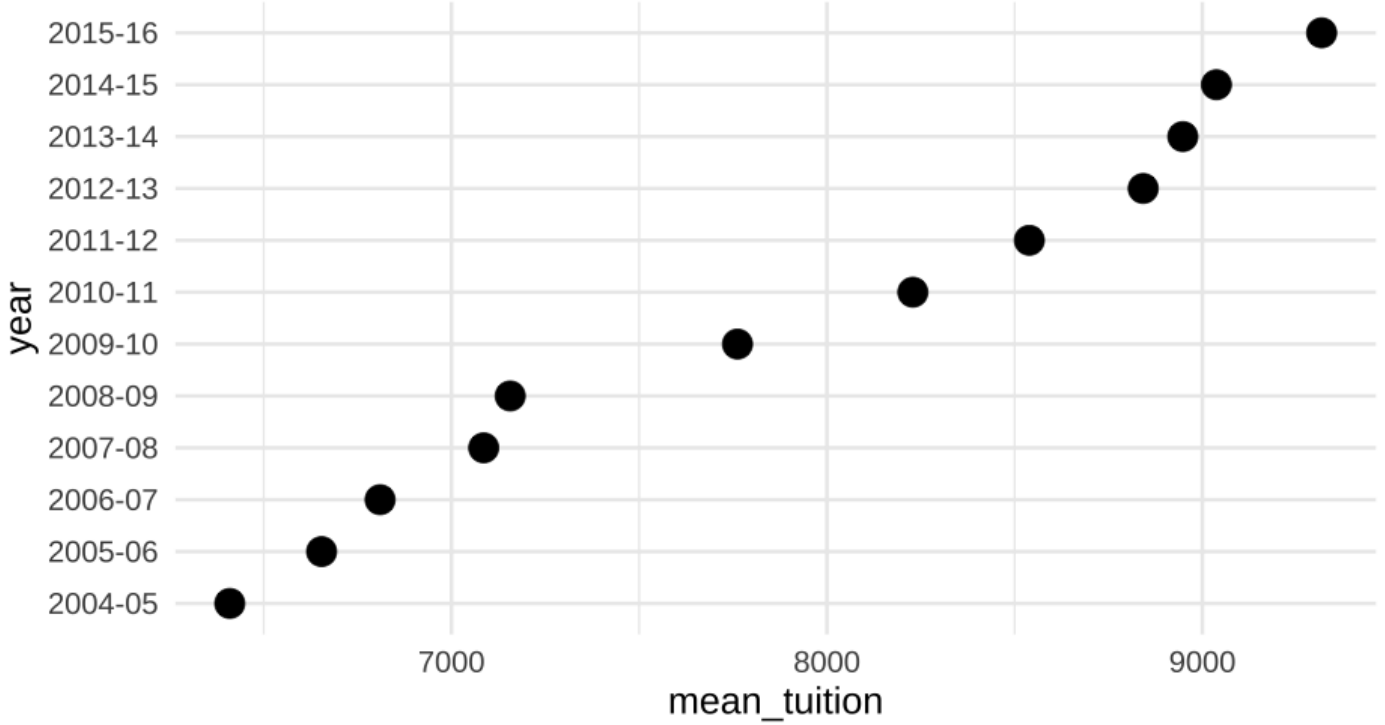
Better?

```
ggplot(annual_means, aes(year, mean_tuition)) +
  geom_col() +
  coord_flip()
```



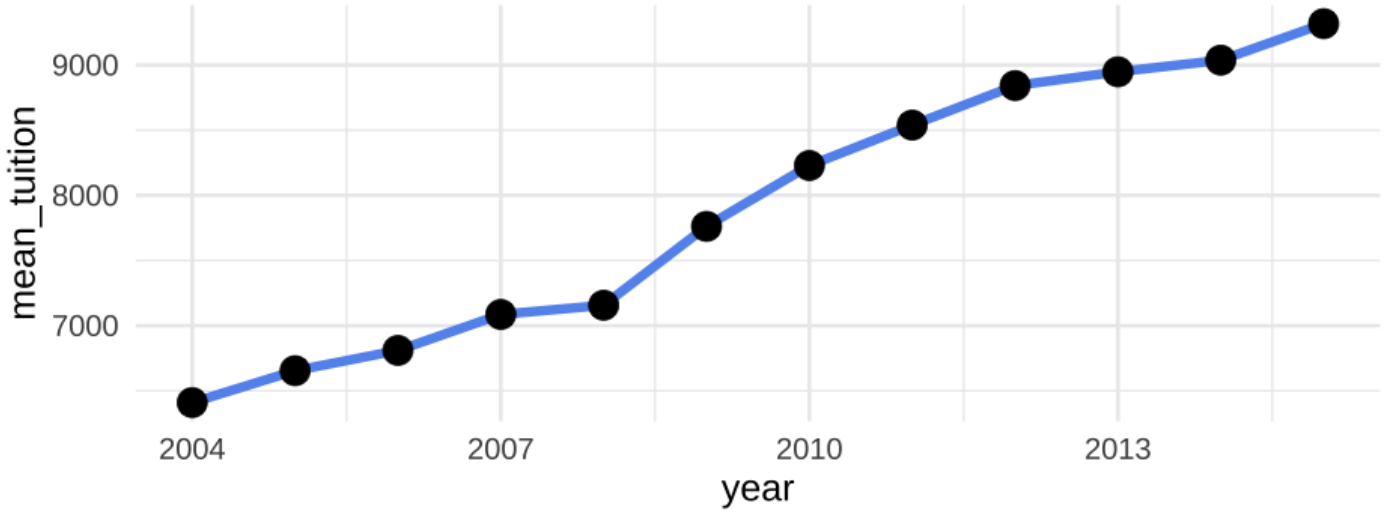
Better still?

```
ggplot(annual_means, aes(year, mean_tuition)) +
  geom_point() +
  coord_flip()
```



Even better

```
annual_means %>%
  mutate(year = readr::parse_number(year)) %>%
  ggplot(aes(year, mean_tuition)) +
    geom_line(color = "cornflowerblue") +
    geom_point()
```



Treat time (year) as a continuous variable

Grouped points

Show change in tuition from 05–06 to 2015–16

```
tuition %>%
  select(State, `2005-06`, `2015-16`)
```

```

Extensions

- I know we're probably running short on time, but we definitely would want to keep going here:
    - Order states according to something more meaningful (starting tuition, ending tuition, or difference in tuition)
    - Meaningful title, e.g., "Change in average tuition over a decade"
    - Consider better color scheme for points

Let's back up a bit

- Lets go back to our full data, but in a format that we can have a `year` variable.

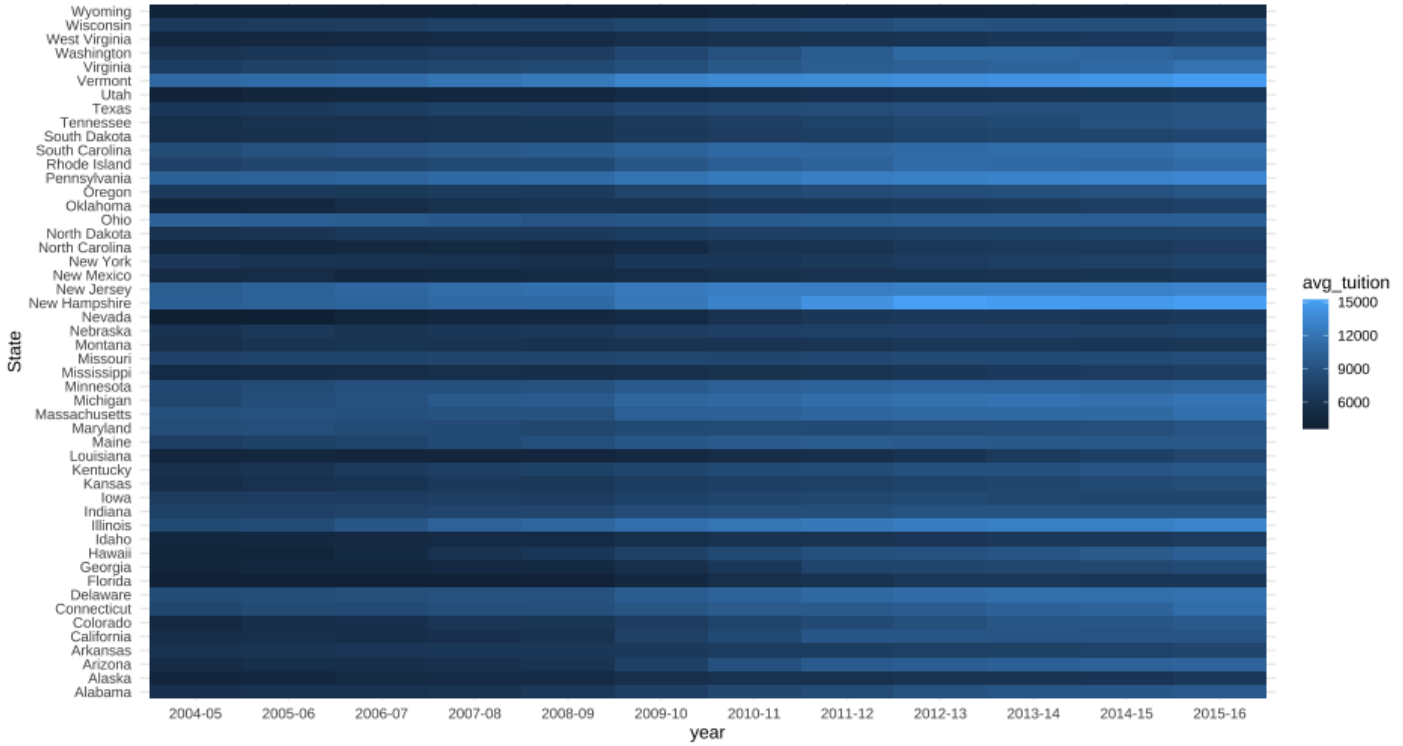
```
tuition_l <- tuition %>%
    pivot_longer(-State,
                 names_to = "year",
                 values_to = "avg_tuition")

tuition_l
```

```
## # A tibble: 600 x 3
##    State   year    avg_tuition
##    <chr>   <chr>         <dbl>
##  1 Alabama 2004-05    5682.838
##  2 Alabama 2005-06    5840.550
##  3 Alabama 2006-07    5753.496
##  4 Alabama 2007-08    6008.169
##  5 Alabama 2008-09    6475.092
##  6 Alabama 2009-10    7188.954
##  7 Alabama 2010-11    8071.134
##  8 Alabama 2011-12    8451.902
##  9 Alabama 2012-13    9098.069
## 10 Alabama 2013-14    9358.929
```

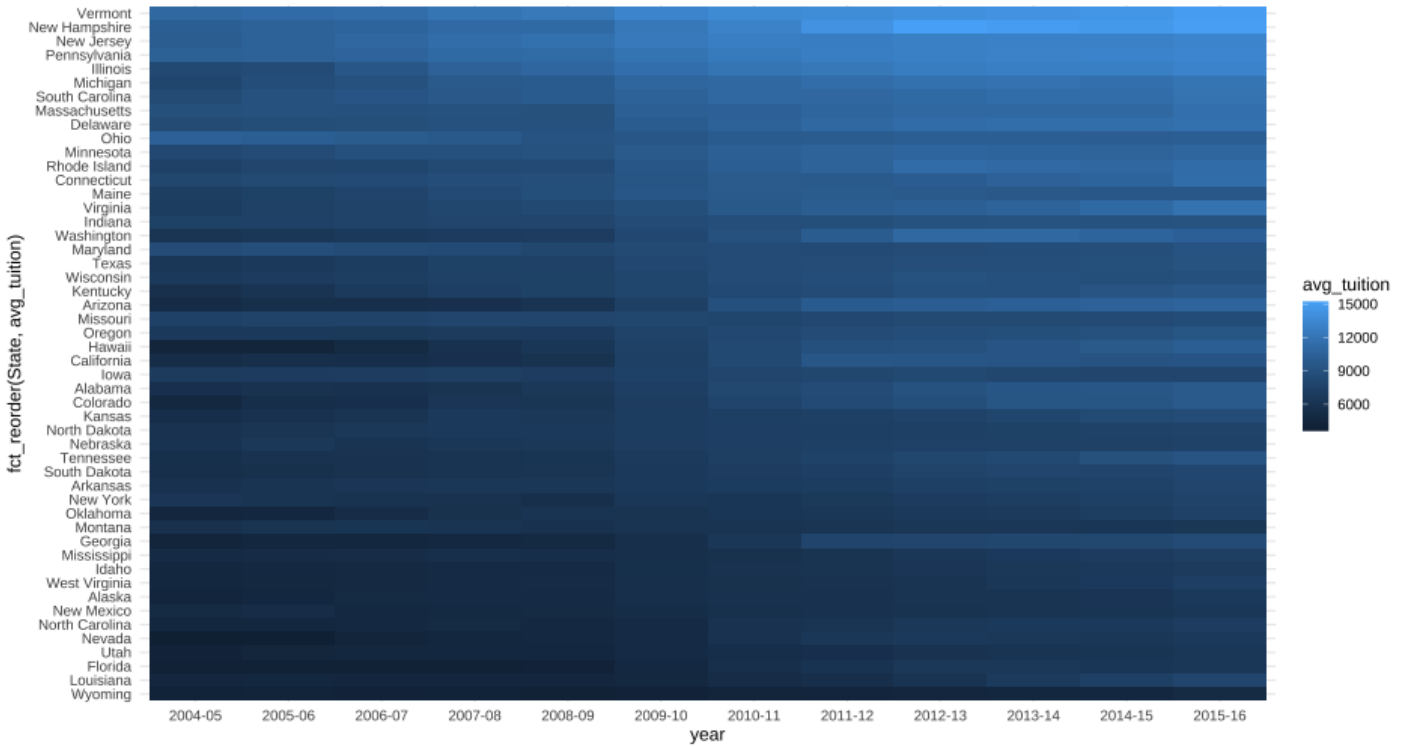
Heatmap

```
ggplot(tuition_l, aes(year, State)) +
  geom_tile(aes(fill = avg_tuition))
```



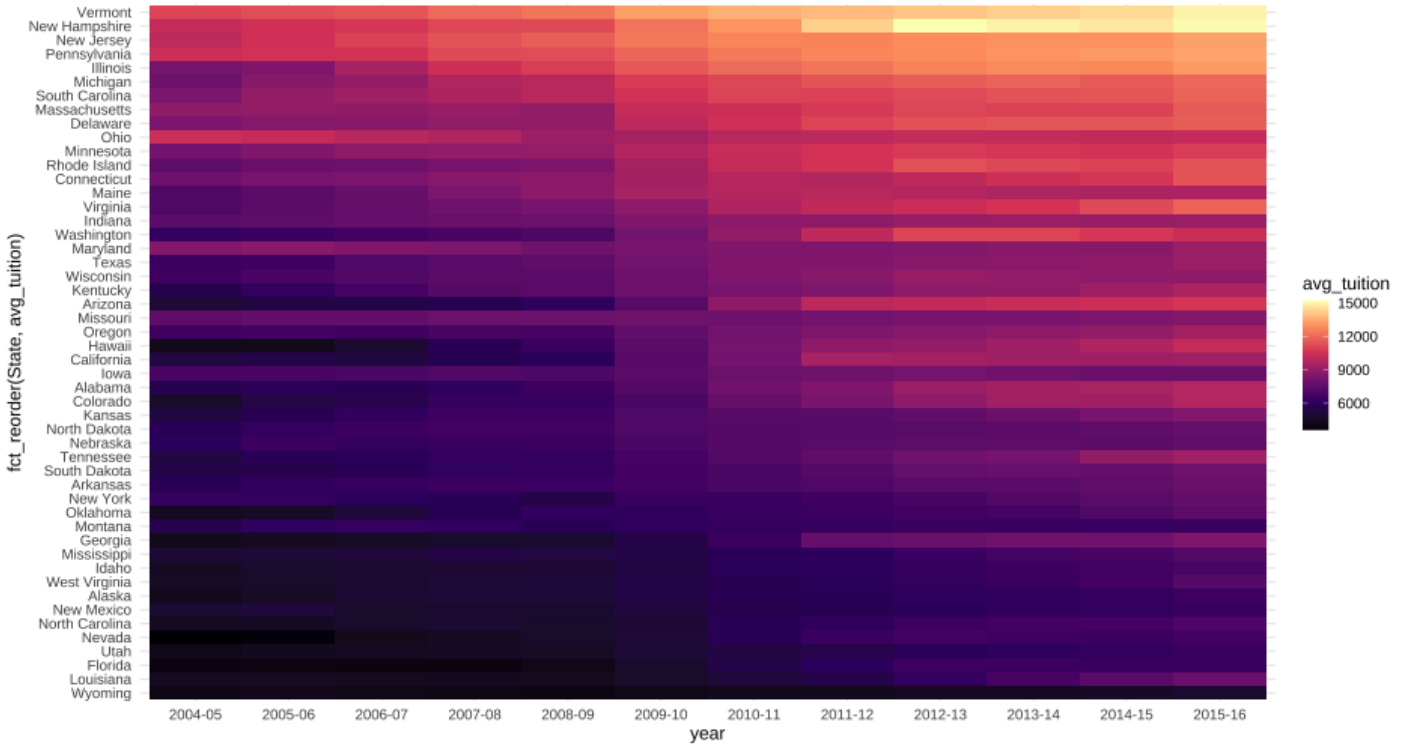
Better heatmap

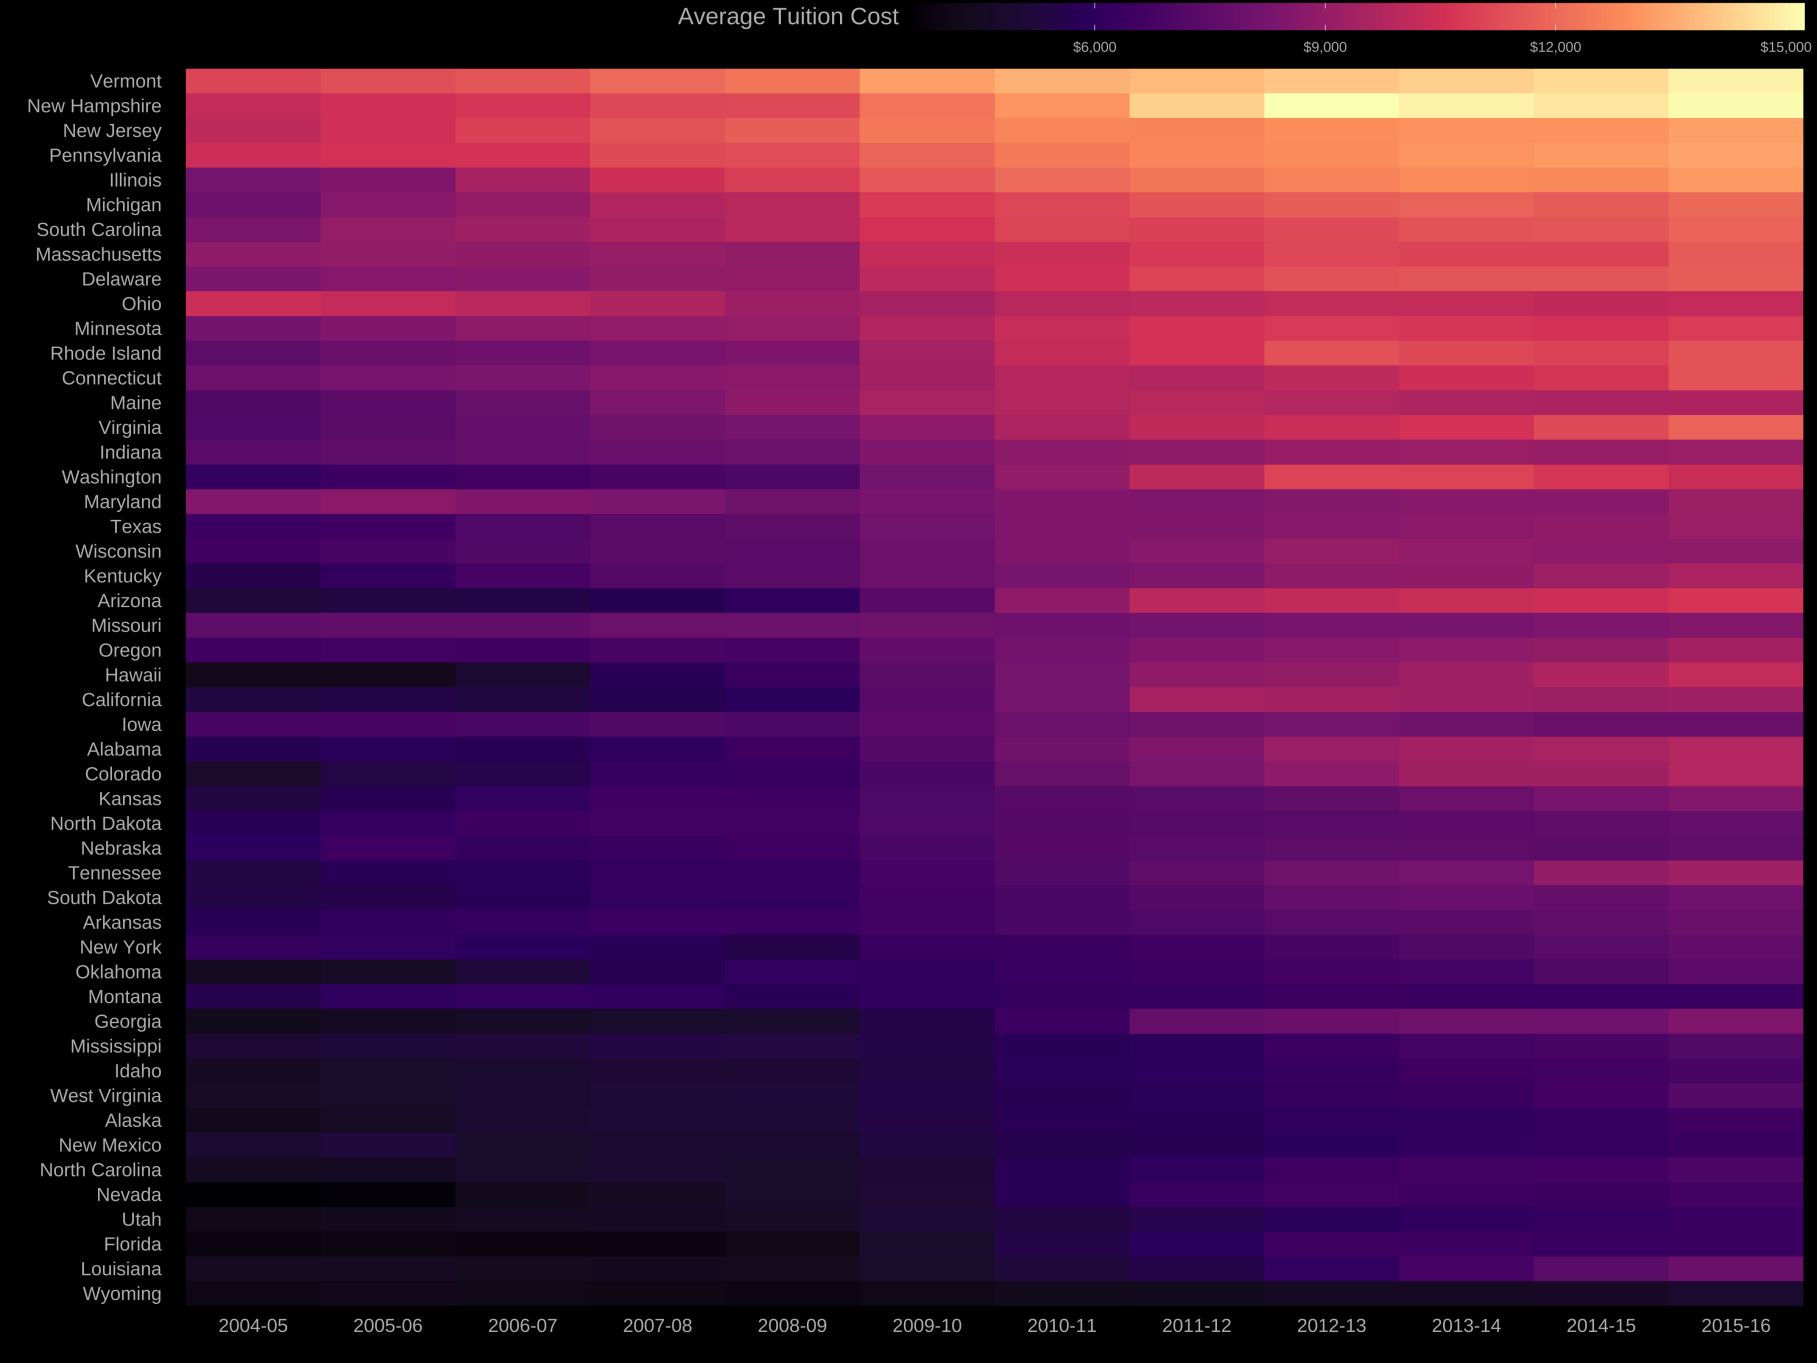
```
ggplot(tuition_l, aes(year, fct_reorder(State, avg_tuition))) +
  geom_tile(aes(fill = avg_tuition))
```



Even better heatmap

```
ggplot(tuition_l, aes(year, fct_reorder(State, avg_tuition))) +
  geom_tile(aes(fill = avg_tuition)) +
  scale_fill_viridis_c(option = "magma")
```





Average Tuition Cost

Quick aside

- Think about the data you have
- Given that these are state–level data, they have a geographic component

```
#install.packages("maps")
state_data <- map_data("state") %>% # ggplot2::map_data
  rename(State = region)
```

Join it

Obviously we'll talk more about joins later

```
tuition <- tuition %>%
  mutate(State = tolower(State))
states <- left_join(state_data, tuition)
head(states)
```

```
##        long      lat group order   State subregion  2004-05 2005-06  200

Wrapping up

- We've got a ways to go – today was just an introduction
- The geographic part in particular was too fast, and we'll talk about better ways later (note that Alaska/Hawaii were not even included)
- We basically didn't talk about multivariate data (not even scatter plots)
- Other types of plots will be embedded within the topics later in the class

Next time

Lab 2

git/GitHub collaboration

It's already posted – feel free to start working on it whenever.

- Must be completed as a group
- Will use elements of what we talked about today, while also asking you to create branches, submit pull requests, etc.
